design3d@2-scale.com wrote on 12/31/01 1:43 PM:

> Atari Hades/040 (Atari Germany has it? Who has it?)

The Hades can be fitted with an 040 or an 060.
These may also be out of production. However I got one last November fitted
with an 060 directly from the maker. It's more or less a really fast TT
clone, but with way better gfx modes. Check out my web page for a
description of my Hades060 setup.

> Atari Medusa/060 (who has it?)

The Medusa was an 040 machine which is no longer in production.
If you are lucky you might find one second hand.

Both machines were made by a company called "Medusa Computer Systems",
not to be confused with Atari Germany.

Hi!

I would like to ask you knowledgable persons for some advice..
What would you recomend as the best Atari ST emulator for the PC?

I used to ahev a Atari ST2 (I think, a pizza box thingy) and I loved playing
Ultima III on it, now I'd like to do that again! (this will be the main
usage of the emulation, playing old Atari games).

So, what would be best, where can I get it, what do I need??

Thanks
Thomas

But we have to be patient. There is still a lot of work to be done if we want all the good things we already have with CAB plus Javascript and more but without the crashes we know from Adamas. But there are some really good and dedicated Atarians involved in the project so it might really happen...

The words "surpass any browser on the ATARI" surely is not a nice
thing for the majority of us. We are ATARIANS but at the lower
level as ST users.As I read it Highwire is aimed at those with
Mega,Falcons and clones.Rather similar to what happend to some of
our last mags. We were lucky that CAB and STiK authors thought of
the whole ATARIAN community when producing their programmes.

>But we have to be patient. There is still a lot of work to be done if we

The last sentence above says it all "there are some really good and
dedicated Atarians involved" and some very good and loyal Atarians
who could lose out.

It's a good thing that someone with a humble Atari ST is able to be part of the Internet using programs like STiK, CAB, and NEWSie. But there are restrictions when you only have 1, 2, maybe 4 MB, a little harddisk, a slow serial port and a 8MHz 68000 processor running TOS 1.0. It's amazing what such a machine can still do - but some things simply are not possible with it.

10. Looking for software

Source record: 39163

Hello,

When I was young, I had ATARI ST(F) and ST(E) computers.
Since 1994, my ATARI has been selling and I bought PC computers until now.

Last week, I was found ST emulator and I will remember about old very good
software and games I used (and show them to friend who have never heard
about ATARI)

I have found a very good web/ftp site for site but nothing for others
applications.

Some applications I look for :
. Activision Music Studio
. Degas Elite
. Neochrome/Neochrome Master
. Spectrum 512
...

If this kind of web site exist, may it be possible to create one ?

Aimed at faster Ataris perhaps, but I never heard it was going to be unusable on STs. CAB surely is not very nice on an STe or ST, and as far as I can tell Highwire has a good change of becoming faster than CAB. Highwire works just fine on both my STe and MegaST anyway.

> >But we have to be patient. There is still a lot of work to be done

I don't see why really, I really don't. You drawing conclusions too soon IMO. A new browser project should aim to surpass any browser on the Atari, shouldn't it?

regards,

Joakim

>So, what would be best, where can I get it, what do I need??

From personal experience I would recommend Steem.

Get it from http://steem.atari.org , however you will also need a TOS image file (scanned from a real Atari - ie TOS v1.0, v1.2, v1.4, 1.6x or v2.0x). I'm not sure where is best to download that (if you have no luck email me).

Cheers!

Message-ID: <a0te42$7bu$2@news7.svr.pol.co.uk>
Source record: 39170

Hi All

Does any one know how to get the Page Preview function working in Texel 2.2?

Whenever I select this from the File menu, with a suitable spreadsheet loaded, all I get is the left hand "menu" with most of the buttons greyed out! I tried blocking an area on the spreadsheet, but no results in Page preview.

Does this function require Artworx? The manual I have is German and also some of alert boxes seem to mention Artworx - is it really required in order to get the best out of Texel?

Can anyone advise?!?

Thanks

Neil 8-(

>

Hi Peter and Newsgroup,
Thank you for your suggestions.

In the NVDI manual, it says that: "Some older programs only
recognize a device driver when it has the first possible code for
that type of device e.g. 21 for a printer drive and 31 for a metafile
driver.

I changed PIN.SYS (dot matrix) to 21 PIN.SYS in the Assign.sys file.
Then set laser printer to 22.
I also took out the default printer line in NVDI.INF file.
I'll chose the printer from the COPS panel.

Atariworks now prints very well (atleast in the foreground,
still working on background printing)
No more GDOS not enough memory errors!

Thank you.

ken

Derek,

HighWire is still in planning. But it has NOT been discussed to aim for
the higher end of the Atari Line. This is not official, but some of the talk
was to have it work on the ST's as a basic browser. But the more cpu intense
"add-ons" (when and if) would be for the upper end.

As GokMasE has already replied, HighWire does run on his ST and Mega.

Message-ID: <ylwY7.48733$Z24.11813852@typhoon.jacksonville.mediaone.net>
Source record: 39175

I just pulled out my old Atari ST FM and am looking for a compiler,assembler, and linker for it. Preferably C. Does anyone know where I could get a good one. I've heard of Hippo-C but I am not sure of its quality. I am also interested in buying any and all ST documentation I can find. I have contacted Abacus Software about their library reference series, but have not received a respose as to if they still carry those books. What are the best web sites for Atari ST info?

Has anyone used the gcc 68000 cross compiler to compile for the Atari ST? I have been working with the MC68328 and MC68VZ328 for the past 2 years and believe my knowledge will be directly portable to the Atari ST? Any comments?

Thank you,

Les

I still see some occasional ports from him being added to the SpareMiNT archive, but if he stops working on Thing completely, what will happen of it? What desktop is left assides from Jinee? I would rather avoid seeing Thing join SPIN, 1st-Guide and other staple applications into oblivion, just because their author lost interrest in the platform. Hopefully, Gryf will decide to release his sources...

> Has anyone used the gcc 68000 cross compiler to compile for the Atari ST?

There exist ready to use RedHat/Suse/Debian/Cygwin packages for the cross
compiling environment. Just download, install and use it.

The Atari and IBM floppy disk formats are almost exactly the SAME.

The easiest thing is to format a 720K DS/DD floppy disk ON THE IBM.

Use the same blank floppy disk as you would use in your Atari, - NOT-
an IBM style 1.44Mb "High Density" disk.

When you format the disk on the IBM be SURE to select "720K" in the
dropdown menu, NOT 1.44Mb.

Formatting the floppy on the IBM insures the disk will be properly set
up to work correctly in BOTH the Atari and IBM.

Then just write the files on the IBM, and read them on the Atari.
Easy.

Note- this assumes you have 720K, Double Sided floppy drive(s) on
your Atari. If you have the old 360K Single Sided drives, all bets
are off.

Also, you CAN use an IBM 1.44Mb HD floppy if you don't have any 720K
DD disks, but it's not optimal. You still MUST format it as a 720K
disk. You may have to start with a brand new, never before formatted
disk, and you may have to cover the HD window (opposite the
write-protect shutter). Better to use a DD disk. (If you still use
the Atari, you should have some of these around.)

And, there ARE programs around which will re-write the boot sector of
an Atari formatted disk to work in an IBM, but why bother? Just
format it on the IBM.

And, there ARE some versions of TOS on the Atari which will properly
format a blank disk to work in both systems, but unless you know yours
is one of these, just format the disk on the IBM to be certain.

I think it's Hisoft C you mean which is basically Lattice C, pretty good.
The Abacus books are good and you often see them for sale for very little.
Sites for info would be (of the top of my head) http://saint.atari.org.
Lattice C also comes with large set of books describing each call.

Martin Tarenskeen <nospam@zonnet.nl> writes:

: I'm using a Falcon without an FPU. Is a 68882 easy to get, and what should
: I pay for one ?

Just looked in a Newark Electronics catalog. Various package types and
speeds run from USD 61.03 to 132.81, each. Anything less that that is
good.

It looks like the cheaper ones are DIP, and the more expensive ones will
fit the socket in a Falcon.

Good hunting.

Hi Neil,

With what sort of system do you work? A TT or ST?
Falcon? 'Cause I don't have the same problem on my TT
with graphic card....And nope, it does not require
Artworx...ArtWorx is mostly for the visualization of
your sheets. The combination is great and fast: just
pick out what you want to have visualized and ArtWorx
creates the diagram...Pie, Stack etc. You get a
default output which can be changed in Artwor. So if
you want to make some flashy visuals accompanying your
'dull' sheets: get Artworx!

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

35. January Release of Eureka

Source record: 39188

Hi all,

I wish you a happy new year, and all the best wishes
for new Atari stuff.

I also must say to you that I placed the January Release
of Eureka on my home page. It's a 2D Graph Describer, and
a 3D Modeller.

The news about Eureka are corrections of errors,
optimization, and cleaning of the sources, so that
the executable is now more tiny and fast. It's since a
long time that I hadn't have the time to make such a
work. So the update is a major update. All that you
ever thought to be corrected, may have been fixed now.
I must also tell you that there's an English version
of formulas included in the package, thanks to the
work of Olivier Liess. The whole soft is close to be
entirely translated.

Thanks to make me any suggestions. You're welcome.

See you for updated news about Atari front-line ...

Regards,

Source record: 39189

Hi

Looking for all your old dead/blown up hardware. Not the actual
motherboards but things like accelerators, video capture cards, graphics
cards, 386 add on cards and so on. Things like that, especially looking
for ones for the Falcon. Or if you have a fully working unit I may be
tempted as well, just offer it to me :)

Accelerators like Nemesis, Centurbo 1 not really wanted. More like big
cards that plug onto the expansion slot in the Falcon. On the ST side
perhaps a simple 16mhz accelerator but _must_ have cache (eg Adspeed)

Email me! Thanks.

Hi,

On 1 Jan 2002 17:52:09 -, Ken Kosut wrote:
>
> Hello,
>
> Is there a file that will give me an American keyboard as opposed to
> a British keyboard?
> And where would I find it?

You should get a keytbl program, available somewhere on Belgian
ftp server (ftp://chapelie.rma.ac.be/atari/ ... I don't know the
exact URL) or from my www site http://gregory.atari.pl/pliki/keytabl.zip
install it and you will be able to switch between various keyboard
layouts (American, French, Polish, German etc.)
The file with keyboard layout is named KEYTABLS.SYS and is placed
in c:/Gemsys/MagiC/Xtension folder, so if you don't want to keep
keytabl program in memory you may just put the KEYTABLS.US from
this prg archive in the mentioned folder and rename it into KEYTABLS.SYS.

BTW Is there a similar easy way of switching keyboard layouts available
in N.AES?

44. Possible STe hack?

Newsgroup: comp.sys.atari.st
Date: 2002-01-02 20:13:37 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <a0vplh$4od$1@news.panix.com>
Source record: 39192

There is a hack for TT machines, which I (still) have the parts for, and will do, involving putting in chips of the physical size, but with an extra address line (pin 5) for greater memory size, and connecting those pin 5s to the unused MAD9 pin of the MMU, through a buffer chip and 43 ohm resistor. That puts 8 megs of ST memory where 2 megs were, by replacing 256 k chips with 1 meg chips.

That makes me wonder why that cannot be done on an STe with TOS 2.06. It has the same MMU, and a TOS that might understand larger memory spaces, so putting in larger SIMMS, and connecting the unconnected memory select line they would have in the original sockets to MAD9 through a buffer chip and a 43 ohm resistor should make a 14 meg machine. Has that been published, or done, or has anyone but me had that idea?

If true, it would take four 8 meg 30 pin SIMMs, one tiny resistor, a foot of wire wrap wire, some hot melt glue, and about an hour of time.

Sounds fine for the TT.

>That makes me wonder why that cannot be done on an STe with TOS 2.06. It
>has the same MMU, and a TOS that might understand larger memory spaces, so

>or done, or has anyone but me had that idea?

Well, ST has MAD 9 also but the max you can get is 4MB. I therefore
assume the TT uses ST RAM in 4 blocks rather than the 2 in the ST.

>If true, it would take four 8 meg 30 pin SIMMs, one tiny resistor, a foot
>of wire wrap wire, some hot melt glue, and about an hour of time.

Four 8 meg simms? That means you'd be wasting (32-16) 16 meg of RAM on
the simm. If there was a way I'm sure there is a more cost effeient way.
If you have 4 banks on a TT then you should be able to use two 72pin 4 meg
simms as these have 2 banks on each simm. Just use sockets here as you
may get EDO ram which AFAIK doesn't work on the ST and probably TT MMU.

Your Subject: line says "via NICs"...

Does this mean you're trying to connect the two PCs using the Ethernet
Network Cards in the PCs?

I don't know of -ANY- ST Emulators which will re-direct the
serial port output from an ST program to the Ethernet Network adapters
in a PC.

That's a nice idea, but as far as I know, it's not implemented in any
emulator.

SOME emulators try to direct the serial output of the Atari programs
to the PC's serial ports. Have you tried a SERIAL Null Modem cable
between the PCs serial ports?

As a small sidenote, the resolution of this machine is not even exactly
200 dpi, it is about 195 x 205 dpi- which can be annoying at times when
you need to scan something with accurate dimensions.

Happy New Year Everybody,

I am new to the Atari computer scene and I have a few questions. First how do I make music in .mod format? I have a falcon, is there any programs I can download (or purchase) that will let me do this? I just got a copy of cubase, but I haven't tried it out yet (can this do mod music?). Is there any place that I can get midi cables that are good for use with the falcon (the cubase manual suggests special cables)? As soon as I can get myself started with making music, I will happily make some music available for all to check out. Thanks in advance.

Later,
Mike

Yes, I know. The manual says "8 Punkte/mm (quer) x 7,7 Punkte/mm (langs)".
That would be 203.20 x 195.58 dpi. Any more info about this strange old
scanner is welcome. The manual coming with the SCAMAI software talks about
a developers disk to help programmers create their own software for this
scanner. Anyone who has this? I also heard about patches that fix some
problems that SCAMAI has on other than 8MHz ST's. The fact that SCAMAI.PRG
is awfully non-compatible with my Falcon is my biggest problem. The only
way I managed to run it was with Backwards III, ST-Mid compatible mode, 8
MHz, NVDI off, HDDRIVER minimal memory consumption mode. Otherwise I keep
getting a message that I don't have enough memory. Or the video output is
faulty. (I have 14 MB in my Falcon: that should be enough for software
that was meant to run on a 1 MB Atari ST).
The software was made somewhere in '89. Programmers didn't care much about
"compatibility". Falcons, Milans, Medusas, Hades, and MagicMacs didn't
exist in those days.

But with the help of this NG maybe one day I will be using my old scanner
on my "new" Falcon030 ?

I have been using Gemulator for some years now - I don't play any games tho'. I use it extensively for LDW Power, ST Writer, Marcel, Gfa Draft, - all while running Neodesk3.2 - without any problems at all. And for my use it seems much smoother and faster than the other emulators, including STeem.

I do run STeem under Linux though as the only other emulator for Linux is STonX, but Gemulator is still the one to beat.

Isn't that the highest resolution of a fax machine? It sure looks
similar to the numbers in ST Fax.

If my old memory banks are correct, there are some physical differences between 1.4 meg floppies and 720k floppies. And 1.4 meg floppy hardware was also different. And this would cause a problem.

You could always hit the electronic junk stores, find an old 720 floppy disk drive, and try sticking it in your PC as floppy drive B and see what happens.

Well if you patronize any of the websites out there, you've probably already seen news about this, but I figured I'd put a shameless plug on the usenet groups anyway ;) http://atari-source.com is up online now. It is your typical web portal system and news site, with semi up-to-the-minute news, software reviews nearly daily, articles, debates, help guides, etc.

I also offer a download section that offers only very up-to-date software, as well as an http software mirror of several of the larges atari ftp sites, updated proactively.

The pledge I make to my visitors of this free site, is that I will get at least one new piece of something up for people to read and play with per day, to make this site worth coming back to daily. So please visit and help make this venture a success.

Thanks
- Mark Duckworth

Falcon030 - Tower cased last night, CT60 soon!
TT030 - Ok so I don't own it but it lives in my house! Nova video CaTTarman, etc
Mega STe - several upgrades performed
AMD 1.2GHz - Some big bloated high powered linux box that runs the site out of my bedroom ;)

Frankly,

I think that there should be development efforts aimed for the higher
end machines. The Atari ST could never ever hope to run Java, but
does that mean we shouldn't have it? Of course not. It sounds as
though the Highwire team is doing _exactly_ what they should be.
Making a basic browser that outpaces cab, with plugin modules to use
the higher horsepower and ram of falcons, TTs, and the likes.

61. Problems of an STe

Newsgroup: comp.sys.atari.st
Date: 2002-01-03 16:04:09 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <a11vdp$oo9$1@news.panix.com>
Source record: 39060

This one, I know about. It has happened twice, and Best Electronics has profited greatly by my want to repair a nice portable machine with a good operating system.

Twice, the disk drive has quit. I took it apart, started probing around, and found that board paths were missing. I put in jumpers, but it still did not work, since, probably, I did not get all the missing paths.

The problem is what some people call vias, and others call feedthroughs, which get conductors from one side of the board to the other. The ST has very few of them, and the TT and Falcon have them gold plated through, which is a very reliable solution.

But the STe not only has about as many vias as there are stars in the skies, it does not use many of them, and the only connection is due to columns of solder. If you temperature cycle such a machine, and I have, those columns of solder (see MIL HDBK 217 for actual numbers) do what is known as "barrel cracking), and which is not usually visible from the surface, and break connection. Thus, and STe works fine and nearly forever if you keep it warm and dry.

But if you load your car in the cool of the night on Thursday night, to drive home after working a contract job far away from home, and leave the STe in the car in the heat of the day on Friday, and let it cool down until Saturday morning, those columns of solder shrink and swell, and crack. The fact that the board layout was reused from something else, so many tracks and many vias are unused, has some small effect on the stiffness of the board in the plane of the board, which makes this effect just a little worse.

The problem is that there are so darn many of these things, and rows of them near the disk drive area, so it could take a very long time to reheat them all, adding just a little solder. But next time that is what I will try first.

The bottom line is if you are going to move an Atari computer around, and let it get hot and then cool down, do it with an ST, or a TT, or a Falcon, not with an STe, or you will spend a lot of money fixing it, if you want it fixed.

And Brad Koda will get to know you as a very good customer.

Source record: 39061
Cross-posted to: rec.games.video.classic,alt.atari-jaguar.discussion,alt.games.lynx,comp.sys.atari.st,rec.games.video.atari

Welcome to 2002 everyone!

Here's what's new at TAT:

* NEW! Araknoid Clone (8-bit) review
* NEW! Report on Jaguar Slam Racer
* NEW! International Karate Plus (ST) Review
* NEW! Jaguar Scores Update!
* NEW! Cool Link
* Revisit: Food Fight for the 7800 review

Here's a snippet from the Slam Racer report:
Gibson is hopeful that Slam Racer will be available soon after Songbird Productions releases Protector SE with the JagFree CD Bypass code. "Well, I hope to finish it pretty quick and have it ready to put out on CD for use with Carl's Protector SE." He does offer up this warning, however. "It could potentially take a very long time to finish Slam Racer. It's playable at the moment, but there's so much stuff needing to be done. I'll make it work on CD so any Jag owners that are left can at least see it."

Lastly, The Atari Times still has a few copies left of the 2001 Year End Issue! Be sure to pick one up soon before they are all gone!

65. The Alternative Party -- Only a few days to go

Newsgroup: comp.sys.atari.st
Date: 2002-01-03 17:13:51 UTC
From: Kristoffer Lawson <setok@fishpool.com>
Message-ID: <a123gf$9qc$2@tron.sci.fi>
Source record: 39063
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Just a week notice that there's only about a week until one of the most
important Atari scene events this year. The Alternative Party covers
everything from Vics to SGIs, from Amigas to Ataris. The weirder and rarer
the better. A three-day event with live performances by Tero Mï¿½yrï¿½nen, Happo,
CnCd, No I Ain't, Pnmf!, Analogia & Telamurska -- ambient to hard industrial.
In addition there will be DJs, plus some of the usual things you can expect at
a computer party: competitions, cool groups etc.

The party takes place in Gloria, Helsinki, Finland from January the 11th to
the 13th. More information about compos, artists and the alternative
scene in general see http://www.altparty.org/, or contact me.

The Alternative Party -- We stand for everything you don't

Hi Bob,
BR>When you format the disk on the IBM be SURE to select "720K" in the
BR>dropdown menu, NOT 1.44Mb.
and think about closing the 'HD hole' if you are formatting a 1.4 meg
disk with 720k.

Excuse me for this extension, but here in Germany it has become
difficult to find 'real' dd floppies...

Message-ID: <200201032053.a37077@su2.maus.de>
Source record: 39121

Hi Bob,

BR>If you have the old 360K Single Sided drives, all bets are off.
that may be right in most cases, but I did format a lot of single sided floppies on both sides and got a 720k floppy with, of course, no warranty for both sides to work properly.

As I understood, single sided floppies are two sided floppies without the producer's warranty, e.g. 2nd choice.

BR>Also, you CAN use an IBM 1.44Mb HD floppy if you don't have any 720K
BR>DD disks, but it's not optimal.
You may lose data on the longhand term.

BR>And, there ARE some versions of TOS on the Atari which will properly
BR>format a blank disk to work in both systems,
Yes, but even within the IBM compatible world, there may arise problems when transferring data from one PC to another.

The Atari is much more tolerant comcerning this topic than any PC, I think.

Und TTschï¿½
ps

A couple of years ago, when prices differed more between DD and HD, we thrilled the 'HD hole' ourselves into DD floppies... :-)

70. Zip file and Magic

Newsgroup: comp.sys.atari.st
Date: 2002-01-03 20:53:25 UTC
From: ebaiz@skyenet.net
Message-ID: <9x3Z7.72$D31.28646@newsfeed.slurp.net>
Source record: 39072

Hello,

I made a zip file which consisted of about 300 items totalling about 5eg using STZip. The resulting file was about 1.28meg. I went back and checked the zip file and was told it was damaged. All this was under Magic. I then made another zip file of the same items only this time I used PKZip and I used SoftPC (a PC emulator). Again, under Magic STZip told me the file was damaged. I then guessed and booted up the Hades under regular TOS and tried again and this time STZip said the file was correct. I got the same result under Geneva. Anyone know why this would be under Magic? I tried the file under Magic using ZipJr and things went fine and I was able to extract all the files.

If anyone has a suggestion, I am all ears...

Edward S. Baiz Jr.

79. How to reduce resolution of graphic on Atari

Newsgroup: comp.sys.atari.st
Date: 2002-01-04 01:00:14 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0201031700.6ac368ad@posting.google.com>
Source record: 39078

Hello everyone,

Over the holidays I found myself with a few large JPEGs sent by relatives that don't fit well on my 640x480 screen. With Imagecopy it is possible to change the size of the file, but I figured there must be a way to change the size of the graphic.

Thus, how do you make a 800 x 600 JPEG into a 640 x 480 one?

Galen

STZip was reported several times to have problems if the root of the
archive contains more than about 100 files (files in archived folders
do not matter). maybe it is something related tyo this bug?

Hi all,

Just before Christmas I asked if anyone knew anything about Blyp. This is the reply I received from STan, one of its programmers. It's reproduced here at his request:

On Mon, 24 Dec 2001, it was written:

> Has anyone come across this little number?

Yes, I've written most of the code ;)

> A very useful tool for editing ST-Guide STG files, you can run a test to see
> if all your links work, and it uses the Olga protocol to instantly reflect
> changes made in said STG files.

Yes, and I hope it will provide much more ;)

> Pity that Jaysoft (Jan Krupka and Stanislav Opichal) seem to have dropped
> development. My email of encouragement was returned with a not known at this
> address type error, does anyone have an up-to-date address, or any news about
> this program?

As someone have already written my address is opichals@seznam.cz and I'm working on ARAnyM at the moment (http://aranym.atari.org). Blyp is hopefuly going to be developed in the future (when I get ARAnyM - as my development platform - running properly). The last plans are to finish viewer mode to be able to browse .STG or .HYP files

You can try http://jaysoft.atari.org/blyp/blyp008g.lzh for latest private beta release (more than a year old one).

best regards

STan
JAY Software

PS: Sorry I can't write to newsgroups, please resend it to the c.s.a.st.
Thank you.

Hi Steve,

>I followed a link to the Cheshunt Computer CLub, it seems you guys have a
>meet real soon now, on the 23rd of January i do beleive, i have some
>questions if i may,

Of course you may ;-)

>can anyone come along?,

Yes indeed - it's about the only place in the UK that I know of where you
can meet fellow Atari enthusiasts in the flesh - although we're actually
fully clothed, to stop the sniggering at the back! ;-)

I'd say that membership was mandatory for anyone living within reach of
Cheshunt, Herts...

>does it cost for first time vistors?,

First-timers get in for nothing, so you can see if you like us without
having to lash out a couple of quid or so!

>any chance of a hot drink?,

Hot drinks and biscuits, all provided :-)

>do we have to bring food for the welshgit,

You got fed in December! ;-)

>do i have to bring a computer with me,

It's best to, but not mandatory.

>how much does advice cost,

Only the cost of your entry fee after your first visit :-)

>do you get beaten senseless if you own a PC,

Only lightly, and only with a soggy rolled-up newspaper.

>what is the secret of life,

42

>what's the lottery numbers for Saturday?.

Ah, now that is one question to which I do not know the answer ;-)

Details of the club can be found on the usual web site...

>Please give us another few days to finish the Atari version 9.10, these
>early January days, and some days more to finish the English version.

Has the STFax driver bug that I reported where it expects to live in a folder
named "MODULE" whereas Papyrus expects it to be in a folder named "MODULES"
been repaired?

It worked superbly with earlier versions of Papyrus where the folder name
was as quoted first.

Cheers

>
>Thus, how do you make a 800 x 600 JPEG into a 640 x 480 one?

I use the ancient Positive Image 2. When I first got it I thought it was slow, still is for dislplaying but the effects happen quite quick, just screen updates can be watched as they happen block by block. This has a Scale option which I use often for web graphic resizing, also has some nice effects and great photo correction. Now, I've never tried Smurf or Photoline or that other great one so I'm a little biased towards this program. It was picked up for a fiver IIRC so I don't care really!

My Falcon died completely. Beyond repair... don't ask... Anyway, I can't afford another Falcon at the moment so I have parts left from it. I'd rather sell them together. Make me and offer. I am in Ontario, Canada.

1. Eclipse with ATI Rage II
2. Wizztronics 14MB card
3. Slot-load SCSI CD-ROM
4. ~2GB SCSI HD
5. NEC Multispin SCSI CD-ROM
6. 33MHz FPU
7. TT-Keyboard (without connector)
8. Atari 4MB card
9. RGB and VGA adaptors
10. 2.5" -> 3.5" IDE adapter

That's it. Best offer wins, buyer pays shipping anywhere in the world. Ta

Joshua.

>(a) "Arguments:"
>What's this for, and how is it used?

Not used this myself, but I think you can specify default options for
the command line. For example, if you install a command-line Zip
program you can specify the extract options by default, something like -x.

>(b) "Document Type:"
>I believe this is where you set which kind of files should have the
>program started if double-clicked (i.e. all .zip files when double
>clicked will automatically start "Stzip" when double-clicked).
>Is it somehow possible to assign more than just one file-type to a
>program? (i.e. *.IMG,*.GIF,*.JPG for a graphical program)

I think you can alter the DESKTOP.INF (sorry, NEWDESK.INF!) to put
extra file types in.

>(c) "Application Type:"
> [TOS] [TOS-takes parameters]

Means the application requires command-line arguments.

> [GEM] [GEM-takes parameters]

As above, except the application is a true GEM application not
text-mode.

> "Default dir:" [Application] [Top Window]

Specifies the working directory for the program. Application means
the directory the prorgam is in (the most usual case - the program
will need to find its resource files etc.), ot the top window that is
open on the desktop (useful for a stand-alone program that works on a
data file that could be anywhere).

> "Parameter:" [Full Path] [File Name]

Not sure of this one.

>Moving on.... Also in the "Options" menu, go to "Desktop Configuration":
>
>(d) "Set default directory as: [Application] [Top Window]
> "Set input parameter:" [Full Path] [File Name Only]

Again, not sure. But it must be similar to above, but for general
use for applications that are not 'installed'. The parameter
option probably indicates whether a filename parameter is taken from

the current directory or from a full path.

>Last, in the "Options" menu as well, go to "Print Screen":
>
>(e) Does this print the whole screen all the time?
>What happens if I have an open folder -will it still print the entire
>screen (icons and all), or will it then generate a file-listing of that
>active window? If so, will it be in "text" or "icon" mode?

It will be a full screen dump of the entire screen.

In Imagecopy 4 you may press - key on the numeric keypad to make
displayed image smaller. When you press +, you make it bigger. Just
to display it properly.

> to display it properly.

I have read your post once again, and sorry, I didn't fully understand
your point ;) The above is OK if you want only to *display* the picture
on 640x480 using Imagecopy. If you want to resize the image *permanently*
and save it in 640x480 size, you must use "Options -> Screen -> Display"
option, and click on "Scale to fit", where you should enter the screen
size. Save options, and Imagecopy will always rescale opened images to
fit the given size, and you will be able to save the scaled image using
standard "Save" option. Note that it only works for making images smaller,
not bigger, so it will take effect on images bigger than the screen size
only. I think this is what you need...?

97. Problem wiht MiNT Library?

Newsgroup: comp.sys.atari.st
Date: 2002-01-04 20:28:07 UTC
From: jba4@po.cwru.edu
Message-ID: <3c360f48.53558230@news.cwru.edu>
Source record: 39089

Hey everyone! I was recently tring to compile a piece of Linux software on my MiNT machine. Miraculously, it compiled with almost no problems once I sorted out some of the library dependecnies necessary (some of the libraries the author intened to be used were named very different things under MiNT). But I still do get on error. The compiler reports that the function gethostbyname(~~~) is not found in the libraries. I did a little searching on Google groups and apparently this is a missing function (am I right?). But some message had mentioned some fixes to this problem. Could anyone help me out here?

BTW, I'm using the most recent GCC compiler and mintlib from sparemint.atari.org

Thanks for any help!

Hello :-)

I've got the official Steinberg Synthworks SY77/TG77 software version 1.13
for ATARI with dongle and user manual :-)

I'm searching the version 1.21 or the more last :-)

I wrote to Philippe GOUTIER (software developper), but he said that he can't
help me :-(

If anyone got the official diskette of the last version (or version 1.21) of
this software, please can you help me ?
Can you sending me a copy of this official diskette in a ZIP file to my
e-mail ?

Thank you in advance for this help :-)

Regards ...

Source record: 39099

Folks,

I just upgraded my old 520ST to 4MB using a 4MB brick. Quite some soldering work... Now I am wondering which is the best TOS to use?

Some homepages say that some TOS's are buggy. Should I use 1.04 or maybe 2.06? Id like to use 2.06 because it supports 1.44 MB floppys...However the 520ST uses 32k EPROMS. Is there a way to make it eat 64k Eproms?

any help is appreciated!

thanks
Chris

102. Re: TOS 2.06 questions

Newsgroup: comp.sys.atari.st
Date: 2002-01-04 23:15:23 UTC
From: Steve Sweet <stevesweet@freeuk.com>
Message-ID: <1010243357.29366.0@eos.uk.clara.net>
Source record: 39114

Hi Hallvard

| I'm working on some documentation for TOS 2.06 and need some help in
figuring a few things out...

We;ve already got the wheel Halvard, unless you think you can improve on
it!. 8-)

Blimey its been while since ive used that beast, been too busy with
MFC42.DLL violations!!

| In the TOS 2.06 "Options" menu, go to "Install Application":
|
| (a) "Arguments:"
| What's this for, and how is it used?

Command line switches, such as for TTP's, you could install ZIP for instance
with the switches for unzip and drop an archive on it icon and have it unzip
to a predefined temp folder automagically.

| (b) "Document Type:"
| I believe this is where you set which kind of files should have the
program started if double-clicked

Spot on, *.TXT, *.DOC, *.ASC etc for QED.APP, *.JPG for gemview, ETC

| Is it somehow possible to assign more than just one file-type to a
| program? (i.e. *.IMG,*.GIF,*.JPG for a graphical program)

Do an install app for all relevant extensions, editing newdesk.inf is
quicker though, i had relevant extensions for GEMview for instance, some for
AniPlayer, *.LZH for lharc, *.zip for ZIP.ttp, etc, you have to remember the
4Kbyte limit for newdesk.inf though, there was a tos patch for this, shell
summat or other.

| (c) "Application Type:"
| [TOS] [TOS-takes parameters]
| [GEM] [GEM-takes parameters]

With this you can force an APP or PRG to use a command line, or a TTP to not
request one, so you can have a *.GTP (Gem Takes Parameters) scenario.

|
| "Default dir:" [Application] [Top Window]
| "Parameter:" [Full Path] [File Name]

This for example would let an archive engine look in the source path for the
file to work with or it will help some app's that are too stupid to find

their resources.

| Can someone explain to me what all the above are for and how they're used?
|
|
| Moving on.... Also in the "Options" menu, go to "Desktop Configuration":
|
| (d) "Set default directory as: [Application] [Top Window]
| "Set input parameter:" [Full Path] [File Name Only]

Used for drag and drop situations where the app needs to know its head from its arse, for instance, some app's couldnt find their config files etc if they are invoked via Drag and drop and they are in a backdropped window.

| I would also like an explanation of the above -what it's for and how it's used.

Old stupid app's would probably use this, if you get a sumsuch.prg cannot find sumsuch.rsc you would use this option.

| Last, in the "Options" menu as well, go to "Print Screen":
|
| (e) Does this print the whole screen all the time?
| What happens if I have an open folder -will it still print the entire
| screen (icons and all), or will it then generate a file-listing of that
| active window? If so, will it be in "text" or "icon" mode?

This is the same as alt-help I believe, does a screen dump to an Epson compatible printer, just makes official the hidden to date print screen..

I would have thought all this info was available, its all in my MegaSTE handbook.

This looks good -- does it work to create any size or just the current
screen resolution?

No, it's not missing. The socket functions are just in a seperate library.
Add -lsocket to the link command line and all will be fine.

> BTW, I'm using the most recent GCC compiler and mintlib from

You may enter any size there, lower or equal to the screen size. You may
actually enter something lower than 640x480, just to make the pictures
fit the window (so it will be 480 minus menu bar). Try that. Note that
it will not deform the newly opened pictures in any way - this option
is just to ensure that *no opened picture will be greater than the defined
size*. Smaller pics will be just opened, and greater ones will be opened
and resized to fit the defined size, which may be smaller than the
screen resolution.

:>> Goto: http://highwire.atari-users.net and take alook....

: The words "surpass any browser on the ATARI" surely is not a nice
: thing for the majority of us. We are ATARIANS but at the lower
: level as ST users.As I read it Highwire is aimed at those with
: Mega,Falcons and clones.Rather similar to what happend to some of
: our last mags. We were lucky that CAB and STiK authors thought of
: the whole ATARIAN community when producing their programmes.

No, we weren't. It meant that the programs were encumbered by the
limitations of small machines and antiquated OSes. Which in turn meant
that people clinging to their antiquated hardware could claim that there
was nothing to gain from upgrading.

:>But we have to be patient. There is still a lot of work to be done if we
:>want all the good things we already have with CAB plus Javascript and more
:>but without the crashes we know from Adamas. But there are some really
:>good and dedicated Atarians involved in the project so it might really
:>happen...

: The last sentence above says it all "there are some really good and
: dedicated Atarians involved" and some very good and loyal Atarians
: who could lose out.

You don't have to lose out. Just upgrade.
Besides, their goals are simply not achievable on a 1-meg ST. It's just
like 24-bit colour, you can't get that on an ST.

I think so.
The paths in the combination MiNT/XaAES could well be longer than in
monolithic systems like MagiC and TOS/GEM

XaAES exclusively uses the facilities offered by MiNT.

>Some homepages say that some TOS's are buggy. Should I use 1.04 or maybe
>2.06? Id like to use 2.06 because it supports 1.44 MB floppys...

In my opinion TOS 2.06 is very much superior to TOS 1.4 and offers some
features which make work quite comfortable.

>However the 520ST uses 32k EPROMS. Is there a way to make it eat 64k Eproms?

It is not quite that simple, i.e. you can't just replace 32k EPROMs with
larger ones because the address space for those chips is limited. You
would have to decode chip-select signals for a new address range starting
at $E00000. There are directions for this modification on atari sites
on the Internet. The modification uses two 128k eproms (27C010 or similar)
installed into first two ROM sockets on the motherboard, with some pins
hanging out. With a certain amount of skill you might modify the schematics
to use four 64K EPROMs hopefully fitting into old sockets on the motherboard
(I am not sure that the pinout is identical)- but you still have to decode
new chip-select signals.

124. Need help with Elite ST mission!

Newsgroup: comp.sys.atari.st
Date: 2002-01-06 13:28:17 UTC
From: Jens Lippmann <jens-lippmann@t-online.de>
Message-ID: <3C3850F1.E63E57FF@t-online.de>
Source record: 39127

Hi all!

I try to complete the Thargoid invasion mission (Elite Atari ST) but in
vain.
As soon as I shoot the space station it vanishes and instead a freighter
appears.
When destroyed, dozens of Thargoids appear out of nothing (it seems like
the
freighter launched them before).
Looong time later when I finished the pack I come back to the planet but

there's no station anymore and every new freighter appears to be the
same
kind of 'thargoid dredger' => same game again.
And only freighters within the 'S' sphere show this curious behaviour.
When I jump out into another system, there's the alien space station
again.
So there seems to be no end to this mission...
This looks buggy - perhaps my game is broken?
Who can help me - please?

Regards, Jens

That could be it. The file worked fine with only about 50 files in it.
Of course, this does not explain why it works under Geneva and regular
TOS. Does not matter as long as I know the resulting zip file is really
ok.

Just use a program like Photoline, Smurf or PhotoTip. These programs
have a "SCALE" function which allows one to shrink or blow up a graphic
file. They all do an excellent job...

If I could do something like this, I would put in 1.04 and 2.06 with a
switch installed to select between the two. 1.04 is compatible with
most software out there. Still, it would not hurt to have the original
1.0 TOS on disk just in case.

thanks for the hint with the self made address decode! In fact I was
wondering how to fit the bigger Eproms into the address space if GLUE
provides chip select signals for the 32k Eproms. This seems to be the
solution.

I suppose that's one of those magic things:-)
Anyway avoid STZip it holds too much bugs to be reliable. Why don't you
use the excellent Arcview together with the newest zip.ttp/unzip.ttp?

TTFN,
Martin

Oh boy does this take me back. You've got one of the early versions that had this bug and you'll not be able to complete this mission. The way I got out of this was to "cheat".

At the password prompt, enter SARA. When it asks again, enter the correct password. Then you can alter a variety of bits of the game, with the important ones in this case being the mission flags. I've dug out a file giving the details as to what you can change and it's available in Protext, RTF and Word 97 format at:

<URL:http://www.my-ste.demon.co.uk/files/elitedoc.zip> (12Kb)

I haven't touched Gfa for a long time but this should do:

```
For a=0 to 255
out 4,a
Next a
```

and if you want values too:

```
For a=0 to 255
out 4,a
print a
Next a
```

I do not remember if it should be out 4 so if this will not work try numbers from range 0-5 (warning - some of this can hang your machine, so tak care)

This is something I also came across years ago.

I seem to remember that you do need to patch the game to make it work. As far as I remember the game has a way of entering codes that it can then be altered (or it might be a way of altering the saved game files?). I'm not sure anymore.

But where to get this info I'm not sure. I'll check my stuff, but I think I may have lost this some years back.

I've just been doing some research also to this problem, but it looks as
if you've got the solution already.

I have discovered the new location of Ian Bell's Elite Pages. It's now to
be found at: http://www.iancqbell.clara.net/elite/ It's recommended to
everyone who has ever played this game!! :)

However I would suggest that you send Ian a copy of this doc, because
apart from the binary of the ST version, there isn't anything onsite for
support of the ST version! (of course there is for other versions).

Cheers!

James

Well hello everybody :-)

I'm really happy to announce that my program 'Organizer' is now available on
his dedicated
web site. Currently, it's all in french, sorry, but I think it isn't very
hard to click the 'Demo'
link and get a view of Organizer. Please note that full english translation
is about to be proceed.

Here is the address : http://m.demange.free.fr/organizer/organizer.htm

I'm waiting for all comments !

Regards...

Mathieu

>

I apologize. I did use -lsocket, but what I dind't notice was that
the compiler was failing on the function gethostbyname2. I did some
checking and apparently this is a very nwe addition to the set of BSD
routines. So maybe MiNT doesn't have it yet. But It wasn't needed.
Sorry about posting wrong info! Thankls for the help!

I did the research for those docs so many years ago, I can't remember when I exactly did it. What I can recall was that an article was published in ST-Amiga Format (that long ago!) that gave a small bit of info about the "Hacker." I just spent a while seeing what else was alterable. I even managed to get it published in my local ST/Amiga user groups newsletter. I'm not sure, but I may even have a copy of that somewhere.

BTW, you've a small typo in the URL. It should be:

<URL:http://www.iancgbell.clara.net/elite/>

>However I would suggest that you send Ian a copy of this doc, because
>apart from the binary of the ST version, there isn't anything onsite for
>support of the ST version! (of course there is for other versions).

I've mailed Ian to ask if he wants to add it to his site, and it's been suggested that the info be added to the alt.fan.elite FAQ :)

Once again time for a small update to Atari Icon Library, and this time you'll find the 5 sets of glow icons that Gunnar Gr&#65533;bel supplied for the Little Big Competition.

```
Here is a short summary of the contents:

88+88 icons for various file types
78+78 icons for applications
5+5 desktop icons (trashcan, clipboard)
12+12 drive icons
5+5 directory icons

Visit Atari Icon Library to download these and many, many other icon
sets:

http://gokmase.atari.org

regards,

Joakim

I recommend John Mcloud's "JML Snap" utility. You can freely choose the
destination path/filename, and it will also dump only the contents of a window
if so desired. That can save a lot of time for magazine reviewers!

I don't have the URL for JML Snap, but it's worth pointing out that he has a
page with free keys for this and for Stewart and MCboot.

Hi all,

In case you have not yet payed TOPP a visit it is a new site dedicated
to tracking down and listing source code for abandoned atari
applications. TOPP stands for "The Orphaned Project Page". For full
details, check out your homepage:

http://topp.atari-users.net)

Currently we are trying to contact as many authors as possible of those
who have written applications that many still has expressed interest in.
The ones we at present are most eager to get in touch with are:

* Gary Priest (Popwatch/Newswatch)
* Joergen Von Bargen (Graftool)
* Holger Weets (ST-GUIDE + lots of other stuff)
* John Rojewski (NEWSie)

There are a lot of applications listed on site that we do not know full
details of, so if you can fill in some gaps regarding development
status, coding language, author details, etc, we would be most grateful
to hear from you.

Best regards,

Joakim

You should also take care of the positions of jumpers used to determine
whether a 2-chip or a 6-chip set of ROMs is used. Also, take care of the
old ROM2 signal in your self-made address decode (see TOS2.06 upgrade
instructions on Atari net sites).

Note that this modification can be developped to various degrees of
complexity: you may replace the old TOS, or you may decide to keep it and
switch between the old one and the new TOS 2.06 inserted in separate sockets
(just one signal has to be re-routed). Or, if you go for the dual-TOS variant,
you may decide to use battery-backed SRAMs for TOS 2.06; power drain of static
RAMs is low and a set of small NiCd batteries should keep charge for a couple
of months. With this option you would be able to modify and re-load TOS 2.06
image at will or replace it with an image of Magic. If you decide to use
SRAMs you should by all means keep the old TOS as well, so that you can
boot and re-load if by some chance the SRAM content becomes corrupt.

cu;

>Any other useful patches/enhancements for TOS 2.06?

There is a "universal" patch utility for TOS 2.06 which has been mentioned
before. With it comes a command file, with brief explanations, for making
a number of patches to a TOS image which can be later burned into EPROMs, e.g:

- relocate TOS to a different starting address;
- set colour mode to 60Hz vertical sync;
- keep RAM-based TOS 2.06 in memory after a reset;
- switch immediately to/from 16 MHz mode in a MegaSTe;
- replace or modify routines for hard disk wait time at booting;
- modify _shell_p, - whatever that is :)
- set default step rates for floppies;
- make TOS 2.06 aware of HD floppy drive;
- format floppies in correct MS-DOS format;
- remove (useless) RAM test at power-up;
- bypass CRC-check routine for TOS content;
- patch some XBIOS routines related to boot;
- correct stack pointer for autoexec (whatever that is, too);
- protect real-time clock in MegaST(e);
- deactivate blitter permanently;
- replace bitmap image of bombs with another bitmaps;
- replace print routines with supposedly faster ones;
- change printer-timeout period;
- set/reset keyclick and margin bell;
- change default keyboard shortcuts;
- set fast-load for all programs;
- bypass search for floppy B after a reset;
- patch getbpb and rwabs BIOS routines (ED floppies, one-FAT disks, etc);
- disable execution of boot sectors from floppies;
- patch for v_opnvwk() routine (VDIFIX patch, whatever that is);
- correct error associated with mshrink(0);
- eliminate window grow- and shrinkboxes (makes TOS desktop fell much faster);
- activate cache for processors >= 68020;
- replace Atari boot-logo with another bitmap image(s);
- replace keyboard mapping;
- patch screen hardcopy routine;
- change system fonts;
- change the appearances of mouse cursor and basic desktop icons;

- modify (translate, etc.) internal .RSC files of TOS (with any RSC editor);
- modify internal (default) NEWDESK.INF;
- increase buffer for NEWDESK.INF up to 32 KB (SHBUF patch); very useful;
- patch eror in GEM scroll routine (ARROWFIX patch);
- change TOS nationality;
- insert your own patches;

Btw. there is a very similar set of patches for TOS 3.06.

The fileselector was one of the major problems I had when making YSEDITOR
suitable for use with the Atari Falcon. I found a replacement gfa routine
somewhere that did the job. Since then YSEDITOR works great on my Falcon
too. In short: yes, there is a workaround.

152. FS: Original Software Oldies

Newsgroup: comp.sys.atari.st
Date: 2002-01-07 20:48:52 UTC
From: s.petersilge@cityweb.de
Message-ID: <3c3daee1.21800116@news.t-online.de>
Source record: 39005

Hello,

I am selling the following Original Software Oldies (German Versions)
through Ebay (Germany):

1. Poison Virus Protection for Atari ST(E), TT and Falcon. Version
from 1996
http://cgi.ebay.de/aw-cgi/eBayISAPI.dll?ViewItem&item=1319280620

2. Quick ST II, Graphics Accelerator for all Atari ST Models. This
Softwarepacket also contains: "Desktop Customizer", "Quick Index" (a
Benchmark Program) and "Monster" (an emulator of 1280 x 960 monitor
resolution).
http://cgi.ebay.de/aw-cgi/eBayISAPI.dll?ViewItem&item=1319282373

3. VIP Professional, a professional spreadsheet program for Atari ST
Computer. Compatible with Lotus 1-2-3.
http://cgi.ebay.de/aw-cgi/eBayISAPI.dll?ViewItem&item=1319283155

If interested please use the links for bidding or send PM.

Greetings
Stefan

That's a pity, because it is not a GFA-Basic related problem.
And since I am programming mostly in Pascal and sometimes in C and
Assembler but do not intend to add any Basic dialect to this list
I see no sense in subscribing to a GFA mailing list.
I tried to read the list without subscribing but did not succeed.
So maybe there is a kind soul out there who could mail me the
answer ?

Thanks
Gerhard

Source record: 39016

This thread is a bit strange so let's sort things out now.

There IS no mechanical difference between 720k disks and 1.4Mb disks,
with the exception of the extra hole.

There IS no electromagnetic difference between later 720k disks (after
they had started producing 1.4Mb disks) and 1.4Mb disk, they were
created on the same production line and just either had one hole
stamped out (720k) or two (1.4Mb).

You can cut a hole in 720k disks and use them as 1.4Mb disks fine, and
you can block the hole in 1.4mb disks and use them as 720k disks.

If you are ONLY using DD disk drives you dont even have to block up
the hole, you only have to do that when using HD disk drives.

How do I know this, one summer working for a manufacturing plant.
Practical experience (making 720k disks into 1.6Mb disks for use with
a SuperMagicom in 1991, and making 1.4Mb disks into 720k disks for use
with Amiga's and ST's today).

165. For sale - Calamus

Newsgroup: comp.sys.atari.st
Date: 2002-01-08 15:38:17 UTC
From: d.e.cohen@qmul.nospam.ac.please.uk.invalid
Message-ID: <1f5ortr.17w3ds52r7nk2N%d.e.cohen@qmul.nospam.ac.please.uk.invalid>
Source record: 39018

I have an old (1995) version of Calamus SL for sale. It is usable, but I think its main value is that for anyone who wants Calamus and hasn't got it, the latest version can be bought at a huge reduction after purchasing this old version.

Calamus SL 2002 is available. Full purchase price is 699 Euros, but the upgrade from my Calamus SL 95 is only 199 Euros. The saving of 500 Euros is around 300 pounds. The euro is omehwehre between 1 US dollar and 90 cents.

Calamus SL2002 works native on any current TOS machine with 16Mb RAM and 20Mb hard disk space (i.e., TT, Falcon, Hades, Milan) and also on any Windows machine. It also runs on Macs with MagicMac.

For full details check at www.calamus.net.

Given the saving, I would like to get 100 pounds for it (you would still save 200 pounds on getting the latest version) but am open to offers.

I have confirmed with Invers Software, who distribute Calamus, that I can sell my version and transfer ownership, so that the new owner gets the benefit of the discount on the upgrade.

It depends, I would not want to subscribe to some Pascal list either. ;-)

Anyway the msgs are available here:

http://atari-users.net/pipermail/gfa_atari-users.net/

The solutions was this post:

on 12/22/01 4:31 PM, Dr.Ambient at g.goebertus@chello.nl wrote:

> I'm not using windows.
> No resource files. Coding the old way. Only way I know.

You can still call wind_update() to lock the screen, and no handle
is needed. Locking the screen stops all other screen activity until you
unlock it. So for example you could do this:

```
wind_update() 'lock screen
fsel_input()
wind_update() 'unlock screen
```

This might solve your redraw problems with the fsel command, but I am not
sure. I don't have a falcon here to do such a test.

> Dr. Ambient (probably asking VERY stupid questions:-)

Don't worry, I think we all have done it at some point. ;-))

Hey, there are several ways of connecting an Atari with cable modem service. The ideal way is having an ethernet card for your Atari and plugging the cable modem straight into it. The only drawback is that you will need a static IP for the service since Atari can't do DHCP at this time. Some ISPs provide a static IP free of charge, some will charge extra. You can get around the DHCP problem by using a hardware firewall/router that will get the IP and then create a NAT network with the Atari getting a non-routable IP. This will also work with DSL if the router can do PPPoE.

Network cards are very hard to come by so another solution is to use a PC or something as a gateway and then using a serial cable to share the internet connection to the Atari. This will go up to 115200 bits per second which is twice as good as 56K. I'm pretty sure you can do a PLIP connection between a Linux and Mint setup. This uses the parallel port for internet sharing and gives very good speeds far superior to the serial. I forget the exact numbers.

On the software side you have an option of using STiNG which has built-in drivers for some NICs or MiNTnet or Magicnet. I never had a broadband connection on my Ataris or share the internet for that matter, I just know it can be done. Hope this helps.

Joshua.

This one is called TP206... or similar.

>Personally I don't have an EPROM programmer and wouldn't know
>exactly how to go about doing this as it's quite a drastic approach,

The patched TOS can also be loaded into RAM for test or permanent use.
And one does not have to implement all the patches.

>but is any of this available as patches which simply go in the AUTO folder?

Yes, some of them. Look on atari ftp sites for files named like SEEKUP*.*,
VDIFIX*.*, ARROW*.*, SHBUF*.*

On 07 Jan 2002 21:14:38 GMT (GMT), Lyndon Amsdon wrote:

>Is that available as one patch or by combining loads of patchs?

Something in between. There is a large command file with sections which
can be switched on or off and which implement corrections from a set
of smaller files. There are also some smaller command files for other tasks
e.g. preparing data files for EPROM chips, etc.

>If so, got the URL?

Yes, look for yourself:

http://www.stud.uni-hamburg.de/users/in5y280/tospatch.html

and on the site there are similar packages for TOSses 1.04, 2.06, 2.06, 3.06
and (some?) 4.04.

Somewhere on some British atari site there is also a variant of this patch
set for English TOS 2.06 - archive called TOSPATUK or something like that.

No you can't do PLIP between Linux and Mint setup. Yes, Linux offers PLIP
and Mint offers PLIP but they are incompatibile.

Anyway you can do PLIP between two Mint boxes or between two Linux boxes.

There are some efforts about porting Mint PLIP into Linux but nothing come
into life yet

Daniel Cohen <d.e.cohen@qmul.ac.uk> writes:

: I have an old (1995) version of Calamus SL for sale. It is usable, but I
: think its main value is that for anyone who wants Calamus and hasn't got
: it, the latest version can be bought at a huge reduction after
: purchasing this old version.

And not only that, it might run on an ST. Versions after 1998, or sometime
around that, will only run in 480 x 640 minimum resolution, which is 80
lines more than a SM125 has. Later versions will run on other machines,
such as my TT, a Falcon, and Clones.

The latest version adds some useful things, but even the older versions
are great programs for DPT.

I have a lot of old ST DD disks that were formatted with extra tracks and sectors. (hey 3.5" disks were expensive once!). I'd like to read them on a PC but have had no luck. There is a PD utility that can read ST formatted disks but is unable to cope with the extra tracks and sectors. If I had an ST I could of course port the files across but I dont. Any ideas?

I have my TT030 running through a cable modem. On the TT030, I'm using a ROM-Port ethernet adapter that I built myself from the available schematics. You have to be lucky like me and find a Genuis III Pocket Ethernet Adapter, though ;-).

The ehternet line is connected to a Windows 98 machine (along with my NeXT Cube and my desktop PC) which is running Microsoft Internet Connection Sharing, believe it or not. I just set Mintnet up correctly. I set the TT's IP address to an internal network number and set the gateway and nameserver to the Windows 98 ICS machine. The ICS machine has two ethernet cards, one for the internal network and one for the cable modem connection. That's all there is to it (aside from trying to set up Windows, which is difficult to explain, but rather easy to do). The TT can browse the Internet and doesn't need a proxy server or anything! Sweet!

There is a DHCP-client for MiNT-Net, although I've never tried it so I
don't know how well it works.

> provide a static IP free of charge, some will charge extra. You can get
> around the DHCP problem by using a hardware firewall/router that will get

> IP. This will also work with DSL if the router can do PPPoE.

This is the best solution even though if you have a PC or Mac too. I'm
using a Cisco DSL-router, this has built-in PPPoE, DHCP and NAT, and
simply plugged into my existing network. All I had to do to get online
with my Ataris, was to change the defaultroute. Very easy, and no special
software or driver is needed on any of the computers. As long as the
computer can reach the gateway (i.e. the router) through TCP/IP somehow,
it will be online.

Hi Joshua,

I've never been quite clear on bits per second and Baud rate. On my
TT030 with a 56K modem connected to Serial 2/Lan I connect to my ISP
at 115200 which I assume is bits per second ?? I remember someone
mentioned a longtime ago, that port speed should be set 2 to 2.5 times
the Baud rate of the Modem ?? Are Baud & BPS two separate type's of
Speed measurments ???

Thanks, Donner......

How old was the PC? Microsoft may have removed that ability from new
software, and maybe hardware too for all I know. I -do- know that when
the Mega was current, I used to do this intentionally and then irritate
all my PC friends with floppies they could read and write too but
couldn't format. <G>

>Speed measurments ???

Yes very different actually, but this is not the reason why you should
use 115200 bps (or higher) with a 56k modem. Modems use compression
algorithms (similar to .ARC, .ZIP, etc) internally so if you send a file
with lots of "empty space" (MS Word .DOC files comes to my mind...) it
will be transfered much faster compared to a .JPG image or other already
compressed data file.

With a serial cable running tcp/ip you will get the same speeds
regardless of what kind of files you transfer.

I have connected my Ataris to broadband (actually 512 kb/sek ADSL) by
using a Netgear RT314 NAT-box and an Ethernet adaptor on one of my TT:s.
I mostly use another TT running 153600 bps myself but as I get around
15000 bps in CAB also for compressed files the speed is quite adequate
compared to my old 28.8k modem with around 3000 bps for compressed files.

Don't forget to visit my other TT running the Webserver Weblight under
Magic. It's online all the time but right now the content is getting a
bit old. I have actually kept it online now for over a year with almost
no problems at all. I have around 98.6% uptime meaured by an external
site (securityspace.com). Url can be found below in the signature:

> mentioned a longtime ago, that port speed should be set 2 to 2.5 times
> the Baud rate of the Modem ?? Are Baud & BPS two separate type's of
> Speed measurments ???

1) With modern modems which do fancy things like compression its always a
good
idea to set the serial interface between the PC and Modem faster than the
speed
at which the modem connects over the Telephone Network. This allows the
maximum benifit
from compression. It can also improve through put where things like error
correction
are in use....

I do remember having a less sophisticated modem where this was not
possible......

2) Strctly BPS = Bits/Sec and is the number of information bytes sent over a
connection.
Baud is the number of signaling elements sent over the link.
These days BAUD is often confused with BPS and widley misused.

Just to explain a little how we can have different signalling rates and data rates ...

For modems up to 1200 Bps there is usually (actually does any one use such slow modems these days)
no difference. Typically these send one "tone" for a binary "0" and another tone for a binary "1".
So for each "BIT" of data there is a signalling element which is one of the two tones
Usually there only very simple logic in the modem, so you can only set the send and receive rates the same...

Modems above 1200 BPS typically they send more Bits per second than signalling elements. So a 2400 Bps
modem will only communicate over the phone network at 1200 Baud.

It does this by encoding pairs of bits and assigning a unique tone, so we now need 4 tones rather than the
two we used above, and we send one signalling element for every two data bits. So the data rate is 2400 BPS
but the signally rate is 1200 baud.

To get faster than 2400 you need to move away from tones and use phase modulation. The Baud rate on the phone line remains at about 1200 baud, but now combinations of 3, 4 or 5 bits are encoded as a single phase change on a carrier.

Of course on the RS232 link between the PC and the Modem Baud = BPS as each Bit is one signalling element on the cable per data bit.

I hope that the above is clear..

>
> Thanks, Donner......

Which PD utility. Have you tried the Gemulator Explorer or Gemulator with
"Windows File System" disabled.
Note this only works in WIN9x (and I assume ME) not in any of the NT derived
versions (NT,2K, XP)...

Even this will only read some disks. For some I had to dust of the ST and
use PARPC (I think thats the one)
to copy the files...

There is one version of Widoze that will read it. Windoze 95 was the last version distributed on floppy disk. To save a disk, they decided to follow, for once, what is sometimes known as the Microsoft Boot Sector Standard, and actually looked at the disk information to see how it was formatted. They used ten sectors, 80 tracks, for 1.62 disks, but Windoze 95 could read any format. For earlier machines, one could use DOS to make up a virtual drive, using the built in help files, and map that to the physical floppy. Windoze 98 lost the help files, later versions give you a dos prompt, but what is there is not really dos. It has been re-written, and did not get better.

Find either Windoze 95 or Dos for Dummies, or both.

Another thing to keep in mind is to avoid confusion between bits and bytes.
Capital 'B' = bytes which is 8 bits. Thus 115200 bps = 14400Bps = 14.4KBps.

Joshua.

You need to use Makedisk by the magnificent Darren Birks, you can get
it from the LGD (little green desktop) http://www.atari.st it is upto
v1.5?

This is a DOS program, and I recommend that you use it in real DOS
mode.

All PC disk drives when being accessed via the int#13 (as makedisk
uses) will handle 80 track 10 sector disks (800kbyte disks).

However some have problems with 82 track 10 sector (820k disks) and a
LOT have trouble with 80 track 11 sector disks (880kbyte disks).

However I have heard that the tool, disk2fdi is quite good at handling
these disks, whether or not you need 2 disk drives to do .ST format I
dont know.

Years ago I played around with a program that allowed you to format a
1.44m pc diskette to 2 megs and boot from it (unlike the M$ format
which is a storage format only). The key to it was a program called
fdread.exe. It claimed to be able to read/write to any format of disk
on the market! And, it is still available. It is part of a shareware
program called win image at: http://www.winimage.com/winimage.htm

Hi, Hallvard.

If it's the same for your STe as for my TT, you need to press Return after inserting the "-x" or whatever. If you need it to stay there permanently, just Save Desktop. My manual so helpfully reminds me read up the docs of the app or utility for details of what arguments are to be used and their syntax.

Charles.

I have my cable modem connected to a harddrive-less PC (which acts a my
gateway/firewall). My other PCs are connected to this machine via
an ethernet hub, and my TT030 is connected to it via a null modem
cable. On my TT, I am running STING with PPP. The Gateway machine
is doing all IP masquerading for the PCs and the TT (and pppd for the TT).

The gateway is running a modified version of Floppy Firewall. I have some info

here:

http://jybolac.virtualave.net/aff/readme.txt

The download:

http://jybolac.virtualave.net/aff/afloppyf.zip

>TosPatch 2.06 german V3.8
>TosPatch 2.06 german V4.0 beta
>
>Perhaps the non language-specific parts can be applied to other language
>TOSes.

Yes, one may encounter this problem. In the "UK" version of the patches
there is the following comment:

```
; BRITAIN.FIL for UK TOS 2.06
; patches taken from 206_REL.FIL v3.8
; by Philip Taylor ptaylor@udcf.gla.ac.uk
; and Darryl Piper drpiper@cix.compulink.co.uk
;
; Other patches can be added to this file, but watch out
; for address differences between German and UK Roms:
; "in the German TOS there is a routine to handle the extra
; German keys at 323A..3293 inclusive, 5A bytes long. So
; any patch above this area has to be at address 5A lower
; in the UK ROMs". Darryl Piper
;
; "but there are other misregistration(s) e.g. the 8x16 font
; is at 33F32 in the UK TOS, but at 33F62 in the German TOS,
; a difference of 30". Philip Taylor
```

For my personal use I started with a German TOS2.06 image (the only one
which I had at that time), translated and slightly modified the RSC files
(e.g. Help dialogs were too big to fit on a low-res screen, and some other
items could use a little tidying-up) and changed the "nationality" byte to
"British". The "nationality" item tells some bi-lingual programs which
language to use. Although, theoretically, this change may affect applications
in unknown ways because of the above-mentioned difference in addresses, I am
not aware of any problems caused by this. If in doubt, one may keep the
"German" nationality, but translate the RSCs and change the keyboard mapping,
so this "Germanity" will be noticed vary rarely, if at all. With a convenient
keyboard-mapping, a non-British user might even use to some benefit the extra
German-keyboard routines in a German TOS.

Message-ID: <3c3d29e5$0$1619$272ea4a1@news.execpc.com>
Source record: 38899

Hello,

When I run Logic 2.5 (music program) over TOS my system font is 8x16.

When I try to run Logic 2.5 over MAGIC/NVDI the system font is 6x6.

Falcon 030.

Shouldn't I have 3 system fonts like an ST?
8x16
8x8
6x6

The problem is when I boot Logic over MAGIC/NVDI, I get garbage
characters. But the program is graphically clear over TOS.
I am trying to determine what is wrong.

Thank You.

disk2fdi worked for me when makedisk didn't.

Go to: http://www.oldskool.org/disk2fdi/

You don't need 2 drives for ST disks, just amiga disks, apparently.

Read the docs that come with either progs, they are
pretty straight forward.

Clocky does.

> In my Mega STe for example I have Swedish TOS. There never was a
> Norwegian TOS, so all STs sold here came with Swedish TOS and a couple

Not quite correct, I have a set of Norwegian TOS-ROMs here, but that's
1.00.

> But all this raises one question....
> would it be possible to edit TOS 2.06, taking a UK version, then just
> replacing the keyboard setup with the Swedish/Norwegian one?

Yes. Earlier versions of TOS have hardcoded support for those
ALT-combinations where needed. This changed from 2.x, from this version on
the ALT-keys can be redefined like the other keys. However, I don't think
this was ever documented, and I'm not sure if there's room for these
additional maps in a UK TOS. The ALT-tables are not of a fixed size like
the ordinary tables, so you might have to disassemble TOS, edit the tables
and assemble again... It's easier to use Clocky!

Hi Hallvard,

HT>Yes, but I've tried to drag the zip file to that ZIPJR.TTP icon
HT>and (at least in theory) the TTP should then handle the zip file with
HT>the "-x" option, but instead just starts and exits right away.
maybe the TTP has some trouble with folders. I'd try again with the
TTP within the same folder as the ZIP file.

If you run the TTP from a shell, e.g. BASH, you'll get error messages.

You may send me a ZIP test file of yours if it's not abnormally large.

Hi Hallvard

| > Old stupid app's would probably use this, if you get a sumsuch.prg cannot
| > find sumsuch.rsc you would use this option.
|
| Looks like it. But without knowing which programs are "stupid" and
| "smart" I'm having a hard time determining exactly what the "default
| dir" and "parameter" settings do and how they affect things, making it
| hard to document it all with clarity and detail.

Well since its done on a per .APP basis, if it works for you as-is, then leave it set to default. If it falls over, toggle it.

I only faintly recall ever having to toggle this and that was for an Archiver shell istr, and the .TTP that fell down was fixed, rendering this point mute.

I have had problems with newer PC floppy drives hooked up to my Falcon and
ST with some disks. Lattice C disk 5 has problems and it can not read the
disk, I've tried quite a few modern PC floppy drives. I have to use an
older drive from ST, Acorn or the old Falcon drive to use some disks.
Just a thought as this disks which are difficult to read with a modern PC
floppy drive do use some odd format to get more on a disk IIRC.

Hi Hallvard

| > >(a) "Arguments:"
| > >What's this for, and how is it used?
| >
| > Not used this myself, but I think you can specify default options for
| > the command line. For example, if you install a command-line Zip
| > program you can specify the extract options by default, something
like -x.
|
| I'm trying to figure this out, and I would think that the above would
| work, but I must have gotten something wrong, so can someone please put
| me on the right track?
|
| I've been trying to "install" the program "ZIPJR.TTP" (which comes as
| part of "ST-zip 2.6"), and looking up the documentation I see that the
| "-x" option is correct for decompressing files, so in the TOS 2.06
| "Install application" window I've put: "-x" (without the quotes)
| in the "Argument:" part.
| Then I've tried to drag a .zip file over to the TTP, but it just returns
| me to the desktop.

Once installed as an application you just double click the file with the
relevant extension to invoke it.

| I've also tried various different options such as "-l" which should list
| the contents of the zip file. Nothing works.
| What am I doing wrong here?

Try -xr, and then try toggling the switch to use Application path instead of
top window.

Hello,

I am looking for the following software. I prefer them to have the manuals too, but just original disks is fine.

NVDI (Latest version or one freely upgradeable to it)

hddriver (Latest version or one freely upgradeable to it)

N.AES (Latest version or one freely upgradeable to it)

Lattice C 5.60 (I actually have the original disks, but lost the manuals. So if you have the manuals for 5.6 or 5.5 I would consider that too)

Pure C Latest Version

Thanks

213. Badly need a cubase2.01 program disk.

Recently I was given a 2nd STe that came with a monitor, so I felt that it was about time I got the old girl running again just to demonstrate to the windows system how a music computer system works.
Scary horror, the cubase disks are screwed, the backups, the backups of the backups, all of it.
Does anyone have an original (non warez preferred, I have a dongle, but warezed would do at a push I suppose)main program Disk for cubase 2.01,that they could zip or Binary image for me?
I never used any of the other stuff like sattellite so I only need disk one.
Oh and does anyone know where I can grab superboot these days, and a mono emulator (I used to LOVE sebra).....oh and decent terminal software, so I could use the beastie as terminal for my Linux box?
Hmmmm tall order, maybe I should tag world peace and a lottery win on the end:)
Thanks and eternaly happiniess be upon anyone who can save me.

Sorry, the oldest I have here is Cubase 3.0 and then the _newer_ Cubase
Score 2.6 but I guess you would need another dongle to use these.

>Oh and does anyone know where I can grab superboot these days, and a mono
>emulator (I used to LOVE sebra).....oh and decent terminal software, so I

Do you Linux users not have any webbrowsers anymore? A quick search on
goggle.com with the keywords "superboot Atari download" gave the link:

http://www.haretuerk.de/atari/apps/apps.html

right away. There you can find Superboot 7.0 for download. I seem to
recall it went up to version 8 or something so if you spend some more
time searching you might find that too. But do not run Superboot with the
system clock set to anything after 31/12-1999 as it has an Y2K bug.

Connect is nowadays freeware and can also be found rather easy...

I agree, and indeed I found a warez disc og it sitting in a box full of sample discs (AND my boot disk too), and guess what....IT loads so it really is my discs that are knackered. I THINK I can strip the crack out and build a legit copy out of it. Perhaps the panic is over. I saw mentioned somewhere on this group a program for reading "oss" formatted ST discs on a PC, if I can get it to read the fastcopy format of my bootdisc then I can make imaes of the floppies so I need never get this scared again.

We had 3.0 and gave it back:) never really got on with it. REALLY like the way you could get it to improv (ie partially crash) by moving the locators while it was playing.

System clock? on an atari? LOL can't remember the last time I set that
thing. I seem to have distan menories of a battery backup for the clock
mind you, don;t know if it was easy to install though.

: However some have problems with 82 track 10 sector (820k disks) and a
: LOT have trouble with 80 track 11 sector disks (880kbyte disks).

Depends on how old a disk drive is. The new ones, and those go back a
ways, are "enviromentally freiendly" and "energy saving", so they
cannot accelerate fast enought to write 11 sector disks. They can read 11
sector disks. When 3 1/2 drives were new, any of them could go plus 5 or
minus 3 tracks, but now tolerances are better maintained, and if you can
get plus two and minus 1 it is pure luck.

How exactly does this Y2K bug present itself? I use Superboot exclusively on my Falcon, with the correct present date set, and I've never had a problem. Is it with Superboot's time setter (which I never use), or does it happen when the system clock is already set to the >1999 date? Thanks! I'd hate to turn on my computer and find I've been doing damage to it the past couple years!

Source record: 38921

You may have seen my cubase thread, well this is related, but I feel it warrants a new thread.
I have managed I think to scrape enough files from the various knackered discs to make ONE that works, the files are in the hands of my windows machine (which could only read them in DOS funnily enough).
The trouble is that I cannot seem to format any discs on either the STe or FM. They are HD's (can't remember when I last saw DD's). I used to use HD's with the STe a fair bit as we bought them by the shitload to feed to the AKAI sampler, so I am bemused, could it be that the write level is fading in both diskdrives, or perhaps more modern HD's have too hugh a bias (or write) current requirement?. Could both drives be unwell?.
Would covering up the HD hole make any difference (I would have thought not, since the Atari should not even be aware of the existance of such things).
If anyone has any advice I Would be inmmensly grateful, as both the system formatter (LOL, yeah I know it sucks, but if you want absolute PC compatibilty you need it right?) and my beloved FastCopy are having trouble.

The longest running (and STILL running) ATARI BBS I can find is:

PayBax BBS 302-454-7797

It runs on FoReM ST software, which is not Y2K compliant, so it thinks the year is 1990-something (complain to MATT SINGER).

I think it's been running for like 12 years now. Can anyone find an older one?

Hi Dave,

I saved your post, you've cleared up some of my confusion.. The last statement "RS232 link between the PC and the Modem = BPS as each bit is one signalling element on the cable per data bit." Question, so how can I tell if my Modem has connected at 56K, as my Soft shows line connection at 115200 ???

Thanks, Donner......

Hi All

I have updated the Tribute to Derek Johnson's Atari-Notes Coloumn, now formally of Sound On Sound Magizine. The last article was December 2001. Derek has for many years been reviewing some of the more unusual programs that have been released for the Atari Platform. His Atari-Notes will be missed, but hopefully this tribute page will attempt to keep it alive.

Here is the link:

http://tamw.atari-users.net/atarinote.htm

Please take a look and read some (or all) of his articles, a great treasury for Atari-Midists (pun intended)

If anyone has any comments to say about Atari-Notes, I will be happy to put it on the page as part of the tribute (with full credit of course!)Email me at tconrardy@hotmail.com with your comments.

Thanks and enjoy Atari-Notes!

Tim Conrardy

>The problem with keyboard mapping programs is that they never handle
>anything but "normal", "Shift" and "Caps-lock" settings.

But some of them do- e.g. UKEX by Ulf Ronald Andersson supports ALT- keyboard mappings, and there are other utilities. Some of them also support the VT-like "compose" system of getting additional characters (i.e. presing ALT and then a pair of keys -in sequence, not simultanously- and the "deadkey" system (pressing a character key and a key with a diacritical mark in sequence).

>In my Mega STe for example I have Swedish TOS. There never was a

>functions (3 or 4 characters) where you have to use the ALT key (I think
>that's the one... the Mega STe's not on at the moment so don't take my
>word for it), and a combination of that and SHIFT.

This makes me think that Swedish TOS may have esentially the same executive code as the German TOS (i.e. with the extra ALT- keyboard routines), just the language being different.

>But all this raises one question....
>would it be possible to edit TOS 2.06, taking a UK version, then just
>replacing the keyboard setup with the Swedish/Norwegian one?

I think not, because it appears that UK TOS does not have the additional code to handle what is needed for ALT-characters, but you may get better results by editing a German or Swedish TOS- i.e. substitute the RSCs with the British ones and keep the Swedish keyboard (or replace the German one with the Swedish).

>What??.

Window ICS provides a NAT, or Network Address Translation, server,
although you wouldn't know unless someone told you. If the computers
on the private network use it as there gateway and nameserver,
everything works fine without any proxy server software.

I think what it is actually doing is accepting requests from computers
within the private network and sending information to the internet.
Responses are then received by the NAT server and re-routed to the
proper computer in the network. But somehow, as if by magic, a proxy
server isn't needed.

Anyone know how these NAT server programs actually work? I'm just
saying what I think I've read, but I probably misunderstood it ;-).

Don't know, but personally I use UNZIP540.TTP which I keep in my
2_UNPACK folder. Dragging any ZIP file to it gives instant
unzipping. Acually I keep MUNPACK.TTP there too, so any MIM or UUE
files are first dragged to that. There is a similar UNLZH.PRG but
mine is V1.72 which doesn't handle some of the latest LZH files.
Is there a later version?

I'd be glad to send any of them to you if you want them (they are
only 116K, 38K and 8K respectively).

Hi Hallvard

| > 2) Set the following:
| >
| > Argument : *.LZH -e
|
| > Argument : -xr *.ZIP
|
| Argh!!!!! I knew my solution had to be too easy...
| What happens is if there are several files of the same type (i.e.
| several ZIP or LZH files) they *all* decompress. I didn't think of that.
| How can I define a file without referring to its name?
|
| I also noticed that while .LZH files always have a folder made, this
| isn't so with .ZIP files.
| It's very frustrating if someone has made a ZIP file without any folder,
| so when you decompress it, the files and sub-folders are scattered all
| over the place!

| Any solution to the above?

RTFM, 8-), there's a switch to cause "Extract zipfile.zip to folder
zipfile".

each
| >Bit is one signalling element on the cable per data bit.
| >
| >I hope that the above is clear..
|
| Hi Dave,
|
| I saved your post, you've cleared up some of my confusion.. The last
| statement "RS232 link between the PC and the Modem = BPS as each bit is
| one signalling element on the cable per data bit." Question, so how
| can I tell if my Modem has connected at 56K, as my Soft shows line
| connection at 115200 ???

115200. that's your DTE speed, modem connect speed is gained by
interrogating the modem after connect, maybe you don't have report codes
enabled, on my modem you specify x4 in the init string to achieve this.

I have a few ST games (needing colour monitor) to dispose of. Say 1
pound
fifty pence each, just to cover postage.

Loom (an adventure game)

The Sentinel (not sure how to describe this).

Trip-a-Tron. Not really a game, but creates psychedelic patterns.

There's also a joystick, say 3 pounds to cover postage.

All items free if collected from North London. I'ld like to get rid of
them.

Note that STinG, one of the major Atari ip stacks, have had NAT support even before Windows ICS came out. Before I got a "broadband" connection I always had the modem connected to my TT and let it handle NAT and had my pc connected to the TT via nullmodem LAN. Like this the Atari provided a rather good fire wall to prevent anyone from the outside to connect to the more vulnerable Windows pc.

>although you wouldn't know unless someone told you. If the computers
>on the private network use it as there gateway and nameserver,
>everything works fine without any proxy server software.

Not everything works fine, but most protocols where the computer behind NAT calls out will work transparently.

NAT prevents anyone outside to initiate a connection to the NAT:ed computers. There are ways to somewhat make things like that to work anyhow dependeing on NAT soft/hardware. My webserver is located behind NAT but any incoming packages on tcp/ip port 80 is forwarded to it by the NAT-box.

Some protocols like video conferences etc use random incoming ports and can be really tricky to use behind NAT.

>I think what it is actually doing is accepting requests from computers
>within the private network and sending information to the internet.
>Responses are then received by the NAT server and re-routed to the
>proper computer in the network. But somehow, as if by magic, a proxy
>server isn't needed.

A proxy server is used to relay a specific protocol to the inside. NAT on the other hand does not care (mostly) what the packets actually caontain.

>Anyone know how these NAT server programs actually work? I'm just
>saying what I think I've read, but I probably misunderstood it ;-).

Basically when you send a package to the outside the header contains the return port number and ip address. The NAT software exchange the local return ip (192.168.0.n) to your global address (213.66.102.17 or so) and change the return port number to a much higher one. It also saves this information in a local table.

When the incoming return package arrives the NAT software checks the destination port number (equals return port number above) and looks in the translation table to see which local ip address this port number was used with. Then it simply inserts the local detination ip address and original port number. Very simple and elegant.

254. FS: Best Electronics ST -> VGA Cable

Newsgroup: comp.sys.atari.st
Date: 2002-01-13 11:23:03 UTC
From: Julian Lewis-Booth <julian@portland.co.uk>
Message-ID: <l_d08.8872$Hg7.861404@news11-gui.server.ntli.net>
Source record: 38951

Hi There,

having a clear up and found this is it any use to anyone?

this is the three way cable with a switch to allow you to run a VGA monitor and TV without having to swap cables around, just push the button and you are switched (after a reboot of course!)

I bought this a couple of years ago used it for 6 months and forgot about it. The cable is in Manchester (in the UK) I dont see much point in shipping it internationally but if there is someone in the UK that can use this drop me a line.

Please use e-mail due to a lack of Atari computers I dont read this NG much now.

Regards

Julian

> years!
>
The problem occurs especially on older Atari computers without a battery
backed-up internal clock. With Superboot you could - before Y2K - set the
correct date and time at bootup manually using Superboot. But this option
can and has to be switched off in the Superboot configuration program.
With a Falcon you didn't need that option switched on before Y2K either,
and you probably had it switched off, so you didn't have any problems.

Superboot can still be used in this century, also with a correct date and
time set. Don't worry, just don't use Superboot to set the date and time.

This is really stupid!

This is the first time that you've put a URL about this survey on comp.sys.atari.st, (I even searched Google to see if there were earlier posts) and then you post this message on a Tuesday, with the deadline for the survey only two days later on a Thursday!

Most people however (myself included) only read newsgroups at the weekend, so you have stopped loads of people (myself included) from voting in your so-called "great" survey.

You claim on your website that you've emailing lots of Atari websites about this, though I've not received anything, nor have I seen anything on the major Atari news sites: Atari.Org, MagiC Online, DHS, My Atari etc.

So it looks as if you have deliberatly ignored the majority of Atari users in this.

Are you stupid or what?

Cheers!

James

I think any 8 bit Atari joystick will work on an ST, but they aren't very good quality compared to some of the aftermarket sticks. My favorite are the Epyx and Wico units that nestle into your palm. One to avoid is the "Best" brand. It has lousy switches.

There's really no difference (or no significant difference) between
the Atari floppy disk format and the IBM PC floppy disk format.

That is, you don't need a "dual format" floppy because they're the
same for both computers.

However, there are some things you have to keep in mind-

The Atari floppy disk drives are 720K Double Sided, Double Density.

They CAN NOT cope with High Density 1.44 Meg floppy disks that are
common in the PC world.

The VERY BEST way to insure compatibility between the two systems is
to take an ATARI floppy disk, a 720 DS/DD floppy, and format it ON
THE PC.

When you format the disk, be sure to select 720K from the dropdown
menu in the Windows Format dialog box- NOT 1.44 Meg.

Then just move the newly formatted floppy to your ST and copy files
onto it. They should be readable on BOTH the ST and the PC.

Notes- if your Atari floppy drive is an old 360K Single Sided unit,
all bets are off.

For best results, use a 720K floppy which has ONLY the Write Protect
window in it. IBM style HD disks can be used, but they're
"non-optimal".

Any joystick that will work on an 8-bit Atari (or Commodore 64 for
that matter) will work on an Atari ST.

The "genuine" "classic" Atari joystick is my all-time favorite
joystick.

They are fairly easily damaged, so you have to exercise some care when
you're playing, but they are quite sensitive and responsive.

I've tried many, many other types and brands and have always come back
to the "classic".

This is the same joystick that was originally shipped with the Atari
2600VCS video game system and the 8-bit Atari systems. It's also the
one Commodore got in trouble over for copying (it was that good).

You'll probably recognize it when you see it.

276. XaAES + SPIN

Newsgroup: comp.sys.atari.st
Date: 2002-01-14 10:45:08 UTC
From: Martin Tarenskeen <nospam@telebyte.nl>
Message-ID: <Pine.MNT.4.31.0201141133260.97-100000@easymint>
Source record: 38976

I finally traced a problem I was having when I tried to use XaAES in combination with SPIN. The problem lies in the order of execution of the vmoose.xdd and spin.xfs files. If spin.xfs is executed first, vmoose.xdd will not do it's work properly. You don't notice this at first, but XaAES crashes with an error message "/dev/moose not found".
Then I removed both files from my mint folder, and copied them back. But this time with vmoose.xdd first and spin.xfs next. XaAES and SPIN now work perfectly together. Problem solved, but still: It shouldn't be like this. These kind of problems should only happen with auto folder programs, not with xdd and xfs files in the mint/multitos folder. I don't know if SPIN, or XaAES, or MiNT is responsible for this strange bug. Because that's what it is, even though I have found a workaround now.

277. Help! I need help from a Geneva User

Newsgroup: comp.sys.atari.st
Date: 2002-01-14 11:07:25 UTC
From: Mike <mhill@cinci.rr.com>
Message-ID: <6he54u808t8brc9o5q4gpk6bo3qiaqcm3h@4ax.com>
Source record: 38977

Hello,

I am having a serious problem I hope another Geneva user can help me with.

My Geneva Utilities Disk is bad. I can't access it at all. I was forced to repartition my hard drive and I can't install the utilites anymore.

If anyone could email me the utilites disk I would sure appreciate it.

I own the program (bought it at MIST years ago) and without the main Geneva disk the utilites disk is worthless. My main disk works great still (and I backed it up)

So if someone could be a sport and send me a zip of the files on the Geneva utilites disk, I would appreciate it.

Mike

Hello,

I debugged SDL a bit more, thanks to people that helped me. So, I made a version for developpers (libs + includes), for those interested.

And I also build a new Quake version with it.

£215 for a Falcon, that seems pretty steep for a ten year old computer.

It's a damn good price for a 14 mb Falcon. I would buy it myself if it
was in the USA. If it was a 10 year old PC you could find it in a trash
bin for free.

I've been out of the scene for a few months, but last I heard that was a pretty reasonable price for a 14MB Falcon + fpu and including p&p. If I'm well off the mark, and you're interested, then make me an offer!

cheers,

Ash

I have several TAC30s. They are O.K., but not great. If money is no
object, I'd recommend an adaptor to use a modern joystick intended for
another system. If the 'old feel' is important, original 2600 era
joysticks can still be found. I've picked up three in recent years.

From: Rodolphe Czuba <rczuba@free.fr>
Message-ID: <3c440d36$0$205$626a54ce@news.free.fr>
Source record: 38990

Hello,

The 060 is now running at 80 MHz !
This is a 60 MHz model and I will try with a 50 MHz model as soon as possible...but it should work too.
I actually finished to solder a very small clock driver to do tries at 100 MHz.

The THERMAL sensor of the 060 is running well and we can read a temperature of 47°C for a 80 MHz 060 running a simple loop to read the temperature and draw it on the screen (some flash accesses, TLV0831 accesses & videl accesses).

Now the SDRAM is tested.
First test is the read of the EEPROM of the DIMM to get parameters to be set into the SDR60 chip.

299. Atari-Source.com is in full swing

Newsgroup: comp.sys.atari.st
Date: 2002-01-15 18:41:06 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <u48tth17t8ci9a@corp.supernews.com>
Source record: 38800

Hey everyone,

Atari-source.com is in full swing. There's new articles and updates daily, news, reviews, help-guides and debates. I work to make sure I release at least something new per day, making this a great place to go for daily news updates about things that are really relevant in the Atari user community. We are geared towards open source, and atari as a useful machine today which includes source code revisions, operating system updates and system hardware upgrades. We syndicate news from atari-users.net and I pull a lot of my news from great places like atari.org and the German site st-computer.net. This site is strictly American/English which is a refreshing change in the many language Atari community.

As the site is a lot of work I am looking for someone to help me administrate and add news and articles. Anyone up for the challenge?

I offer free advertising to any atari related COMMERCIAL or non-commercial product project or website. I don't think atari developers or users need to be held back with silly advertising fees.

That is pretty much all, so come check us out if you haven't already,
http://atari-source.com
If you have already, Thank you

Tried that. I was going to hopefully see if I could send the disk to
him and get a new one for a small fee, or see if he had my name in
their records (if they kept them) and he could just email it to me.
Never heard back.

I checled the email address I got from the Gribnif web site and it is
the same as what you posted.

For the most part the utilites disk isn't a biggie, but I always liked
Flexmenu and was trying to reload it, and it requires the utilites
disk to work properly under Geneva.

YES!!

go here. Its my Download faq page but I have links to all the dealers
pages. Good ones are B& C Computer visions and Best Electronics.

For the most part, they should work fine. I have plugged in my old
Atari 8-bit joysticks into my ST and used them without any problems.

It's not an orgainiser - I'm not sure what it is! It's been quite a few years since I had my
Falcon and I just discovered a bundle of software tucked at the back of the wardrobe.

The Fort Wayne Atari user group (A.C.O.R.N. - Atari Computer Owners Resource Network) ran a BBS from the mid-80's until a year or two ago. I don't know the exact dates and the BBS continued long after the group folded. The BBS owner liked the FoReM games and kept it going until he moved last year. The BBS started on an original 520ST that was fine for a single-line BBS. It started with a hard disk (20 meg - big then but tiny by today's standards) that was upgraded and a CD ROM drive was added at some point. It sat on a table in the owner's basement and just kept chugging away year after year after year. It was still running fine when he pulled the plug.

People on PayBax might remember it.

It's amazing how many people rab BBSs back in the "old days"!! I ran Toad Hall from 1987 until about 1999. I started out with MichTron, but reluctantly went to RatSoft to be able to use a faster modem. I also started with a 20-meg drive and eventually had at least 1-gig and a CD-ROM. I hated to shut it down, but the internet and long-distance charges after I moved out of the city made it a dinosaur. Those were terrific days and I really miss the friends and activity because of the BBS.

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 01/16/2002

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 2.50 Art & Film Director (Epyx) -- $5.20 shipping, due to
weight, counts as 1st item
$ 2.50 Death Sword (Epyx)
$ 2.50 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 2.50 Final Assault (Epyx)
$ 2.50 GFL Championship Football (Gamestar)
$ 2.50 Keith Van Eron's Pro Soccer (Microplay)
$ 2.50 Lands of Havoc (Antic Software)
$ 2.50 Mean 18 Famous Course Disk Volume II (Accolade)
$ 2.50 Metro Cross (U.S. Gold / Epyx)
$ 2.50 Paint Pro (Abacus Software)
$ 2.50 Quadralien (Spinnaker)
$ 2.50 Renegade (Taito)
$ 2.50 SwiftaR (Accustar)
$ 2.50 Techno Cop (U.S. Gold / Epyx)

$ 2.50 Warship (Strategic Simulations, Inc.)
$ 2.50 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 2.50 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 2.50 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 2.50 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 2.50 Slayer (Hewson) -- NO SHRINKWRAP!
$ 2.50 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 5.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.20 shipping, due to weight, counts as 1st item

$ 5.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 5.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 5.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 5.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 5.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 5.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.20
shipping, due to weight, counts as 1st item

$ 5.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very
rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list.

4) Buyer has seven (7) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D. So
if you can't mail the payment within 7 days, please do NOT order!

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either Personal Check, money
order, Cashier's Check, cash or PayPal. Orders from outside the
U.S. are also accepted (postal money order, PayPal or cash only!)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

>
> Hallvard

Hallvard,

I have used occasionally a PC at the local college to download Atari files. The only extra files I have seen a PC write to the disk are related to storing and recovering information about long filenames. The Atari OS doesn't need them, and gives a false determination of their size. The Atari says they are huge in size, but they are not, and can be deleted with no apparent effect to the Atari data.

I'm still looking for an efficient way to transfer files between Mac and Atari. So far, all I do is via floppies. Unfortunately, most of my Atari disks are formatted with extra tracks or sectors, and the Mac can't read them.

I'm wondering if HD Driver can format a hard drive that is readable by both Atari and Mac?

An good Ethernet solution for the TT would sure be nice. I have an ethernet/cable router that has a serial printer port. I thought I might try getting data to the TT via the serial port on the router. I don't expect it to work, but may be worth a try. I still haven't tried doing Mac to TT via the TT LAN port, which I've been told will work.

Bill Freeman

I just put a pair of RCA jacks on the back of my STfm. Pin 1 is audio
(upper left), and pin 2 is composite. Pin 13 is ground (the odd one at
the bottom).

There is a good site for the atari connectors, etc. I thought I had it
saved. Anybody remember?

As far as I'm aware, neither Windows or MSDOS writes ANYTHING to a floppy disk, other than the files you're copying to the disk.

The only time any "system" files are written is when you SPECIFICALLY ask that the system files be transferred, as in making a "boot disk" or "startup disk". This is done either by using the "SYS" command in DOS, by specifying the "/s" switch when formatting, or by using the "Make Startup Disk" routine in Windows.

(Note- I'm not certain about WindowsNT or any of its derivatives, including Windows2000 and XP, but I doubt they're any different regarding data disks.)

The earlier claim that "Windows writes something, I don't know what it is, but it writes SOMETHING to floppy disks", as far as I know, is nothing but "Microsoft phobia".

On a freshly formatted, blank floppy, with 1,457,664 bytes of
available storage, you should be able to copy 1,457,664 bytes of data
to the disk.

This is one of the reasons I stick to Atari for most uses! The actual
author of the software responds to user questions and support.

Same goes with HDDriver and Uve S. Maybe Andras Kromke is still lurking
here too sometimes...

A big Thank You for the great Geneva/Neodesk programs over the years! Can
still be used to show off The Windows desktop users... :-)

If you are talking of ZORG, it's a floppy/hard disk utility
somewhat similar to Diamond Edge. Doesn't work properly in mono
rez as the dialog backgrounds all come out black.

In theory, wouldn't using a very large cooler like that of an AMD
athalon or something help out a lot with an intense overclocking of an
060? How cool can you make an 060 if the metal core does not hang out
like it does on newer and faster processors.

Source record: 38832

Actually,

If you read my message, you'd see that my site is geared towards updates both of software and of hardware. Broadband internet connections and the likes. You'd see that I have many articles on ethernet access amongst other things. My site has relatively little graphics, a lot of it is browser processing. The topic images are tiny, and CAB is the deficient one here. A Mac with a 68030 and netscape can load up my page just fine which leads me to believe the problem lies where...

I agree with you that the site is too bloated for use on a real atari st, but honestly, it was never designed for it to begin with.

HTML editor? It's a postnuke site. It uses the postnuke content management system which is written in the web scripting language php. I would have written my own content management system for this as I know php quite well, but I do not have the time nor the energy to undertake such a difficult task.

The diehard user like you has both good and bad side-effects. The good side-effect is that stuff is still backwards compatible. The bad side-effect is that if everything in this world is backwards compatible nothing will ever advance and become better. Is the solution to dumb down my site, or is the solution to give your atari some horsepower and support another devoted atarian in his ethernet project.... or to keep your slow atari and also invest in something with a little bit more pep. I don't think I'm wrong here.

And if the HTML of my site ends up being wrong, I apologize for that. If it renders right for me in IE, Netscape, Opera, and Konqueror, I am not too worried about it.

Mark....

What is it? Attack mark day? Maybe I'll think twice before trying to be nice...

I would like to get the sourcecode to Octopus to implement a telnet interface to it such that we could all utilize the glory of the internet to continue and expand our atari bbs's. Also I think ConNect would be great with the ability to telnet with STiK. ssh would be even better.

Just a thought. Anyone know how to get ahold of the ConNect author?

Just checked with my "broadband" enabled Atari TT 256 colours and CAB 2.8. What is a bit annoying is that it takes 1 min 20 seconds before anything displays at all. This has to do with how CAB calculates tables. Actually this is on the slow side compared to most other web pages. On the other hand the rest goes rather quick. After 1 min 35 sec everyting is there and it looks perfectly fine in CAB and so far everything I have tested displays OK. Images are indeed small so I guess it would not take much longer on a modem line.

>I agree with you that the site is too bloated for use on a real atari
>st, but honestly, it was never designed for it to begin with.

Well I have not tried it but if you multiply the figures above with 3.75 I guess you get the display times for an 8 MHz ST.

Simply turn off the image display but as the gifs ar not too many I guess you will not get much faster results from that.

>> On 15 Jan 2002 13:41:06 , Mark Duckworth wrote:

MIDI cables can get very long but you will need amplifiers on the way as sometimes is needed in public theaters. I really don't know how long MIDI cables two Ataris can handle. I guess some 20-30 m would work fine. I have used 20 m nullmodem cables at 57600 bps and that did work fine.

>you network a MiNTnet side to a STiNG side on the other?

As for tcp/ip yes. As for BNET I don't think so. On the other hand Magicnet with its Samba client would be an alternative. You better check with the BNET author as he would know best. http://users.otenet.gr/~papval/

335. [Epyx Shrine] Updated

Newsgroup: comp.sys.atari.st
Date: 2002-01-17 11:01:43 UTC
From: Manuel Polik <mpolik@neulandmm.de>
Message-ID: <3C46AF17.8155A3C7@neulandmm.de>
Source record: 38839

Hi there!

I finally managed to update the Epyx Shrine (
http://home.arcor.de/cybergoth) a little.

The section with the F-Rated games (The Worst Of Epyx?! :-)) is now
completed, introducing new pages for:

The Games: Winter Edition
Street Sports Football
Snow Strike
Zarlor Mercenary

Disclaimer: Since I'm getting asked from time to time "How can you rate
my beloved XXX game with 'F'?" here's the answer: It's not _me_ who
rated the games, but the visitors of the page who regularly answered the
polls last year... - The next round of polls just started!

The catalog section now features scans from Epyx catalogs from '82-'85
and I'm still searching one from '86... :-)

Greetings,
Manuel

The information I gave here is not "Microsoft Phobia", and it is not a
"claim", it is a fact. I have transferred a lot of files, downloaded
from the internet on a PC, to my TT. I was doing this because the PC at
the college was on a T1 line and I could do it there a lot faster than
from my home. I am not a regular user of Microsoft, and therefore I
don't have experience with every iteration of their arcane OS, but the
PCees I have used in the past, absolutely positively wrote additional
files containing filename information on the Atari disk. I believe they
were running Windows 95 at the time.

Just because you personally have never seen something, does not prove
that it doesn't exist.

For true Atarians I would be much easier if you quoted the messages
properly. That's original message above, answer below.
See <URI:http://www.xs4all.nl/~hensema/quote/quote.html> (Dutch language)
or <URI:http://home.online.no/~vidaandr/news/FAQquoting.html>

Also, if you are so concerned about the phone bill, why did you quote the
complete original message?

CU,
Martin

Yes, that's exactly what it does, insert a ~.

> I didn't know that the filenames changed in size if used long filenames.
> Are you saying that the file sizes aren't as big as they are shown (i.e.
> "view as text" on the Atari ST desktop) and the floppy reports "disk
> full" when there really is a lot of space left?
> Or... do long filenames really take up a lot of extra disk-space?

The files are essentially unchanged in size. There may be a few bytes
one way or the other.

The PC added some cryptic filenames, I presume one for each file that
contained some data. These extra filenames are apparently related to
storing the long filename information. The added "name" files are shown
by the Atari OS to be very large, but they are actually small.
Apparently whatever is written there by the PC can't be calculated for
filesize by the Atari.

>
> What should I be looking for in order to find (and delete) those extra
> Windows specific files related to long names?

They will show up in the Atari file selector, if they are there. Maybe
the later Microsoft OS doesn't even use them. It was about 5 years ago
that I was seeing this on my disks, I think it was when Windows 95 was
the OS. It has been that long since I used a PC to download files for
my Atari.

I can't remember if they can be deleted directly or not. I don't
remember having to reformat the disks to get them off. I'll see if I
still have some floppies around with the extra filename info. It's been
a while since I was doing this and don't remember all the details.

> There's no windoze-specific data stored on the disks related to view

I thought all the Mac wrote was data required for the Macintosh Finder.
The Mac OS writes two or three small files and does use a little bit of
space.

Thanks for the information about MagicMac. I did not know it would read
an Atari hard disk. I just bought MagicMac v.2 but haven't read the
manual or used it very much yet. I will see if it will read one of my
external Atari hard drives.

What software are you using for your Atari CD burner?

For Barbarian, you have to press F1 or F2 to start a 1 or
2 player game. As long as the emulator allows these
keys, you are okay (should be anyway...)

I noticed from this article a release of an Atari magazine.
Would it be possible for a old Atari user or writer to offer some
support, because at this rate I think it will become another STraTos.
If these magazines are going to survive it will need wider support from
our community. I appreciate looking at Atari websites, but I am of the
old way of reading and enjoying the smell of print. Or could it be possible
to create from all the websites and newgroup users a simple magazine
of STraTos fame in size and punch. I understand from circulation restriction
that our good suppliers of previous STFormat, StWorld and others, were drop
due to lack of publication issues of a set amount. Would this apply to our
colleagues in France.
I for one happlier like to obtain a subscription from said person who
is offering aTTos magazines this is my support. Can someone who
know the information needed to buy aTTos magazines issue via postal.

regards an ardent supporter

If this is the case, there was something else writing the extra info.

In my experience with Windows[0] the only thing "extra" that gets
written to disc are the "long file names"[1]. This does appear in a
desktop window as a file with a size of -1 bytes. While these don't take
up any space in the data area of the disc, they do take up directory
entries and will often ensure that folders are required to write many
short files. These "files" are the same that are written by Magic where
LFNs are enabled.

One other thing I've noticed with Windows 98 is that it will modify the
boot sector by writing a serial number to it if the disc was formatted
by DOS, or a DOS-compatible formatter. Since I don't have access to
Win95, nor Win2K, any longer I can't say if these modify the boot
sector. WinXP hasn't modified any of the floppies I've "shown" it as
yet.

One tip if you [2] are transferring files from a Windows system is to
delete the files on the PC. This ensures the LFNs are removed [3]

[0] 95b, 98, ME, 2K and XP

[1] This also includes files that are in 8.3 format that have lowercase
letters.

[2] generic "you" rather than specific

[3] If you're [2] using Magic v5+ with LFNs enabled, you can delete the
files on an Atari and Magic should remove the LFNs.

Regards,
David Bolt

Per the schematics, monitor connector is assigned thus:

1 = Audio Out
2 = Composite Out
3 = GPO (general purpose out?)
4 = Monochrome On
5 = Audio In
6 = Green Out
7 = Red Out
8 = Mode Switch
9 = Horiz Sync
10 = Blue Out
11 = Monochrome Out
12 = Vert Sync
13 = Ground

I suppose you mean "login system".

I did manage to register and then log in using CAB 2.8 with Ackerman OVL
and STinG. I had to press the forward button in CAB as the page "wait
while you will get logged in" kept reloading itself all the time. Then I
found the cockie set and after som page reload I got properly logged in.

Tried to send a private message to myself and that worked too. Also
posted a short comment to the Christmas Aniplayer article with success.

However when I tried to vote there was an error. All I got was:

Warning: Failed opening 'modules//.php' for inclusion
(include_path='.:/usr/local/lib/php') in /www/htdocs/modules.php
on line 41

in return without a proper html header. Maybe CAB confuses the site?

As a whole I found the site to work fairly well with CAB but it might be
an expensive experience if you pay by the minute.

349. To Earthlink/Stik Users

Newsgroup: comp.sys.atari.st
Date: 2002-01-17 21:15:33 UTC
From: swampfax@atlantic.net
Message-ID: <V9H18.27$CL6.16786@news1.atlantic.net>
Source record: 38853

Hi All,
Just thought I'd pass on some log-in info to Earthlink users using
Stik. Again, they changed my local phone# and Stik would'nt connect.
Using Starcall (or other terminal program) I saw the login prompt line as:

arc-10a.ocala login:

Stik could'nt find "login:" but did find "ocala login:". I tried using *
at different points in the script but no go. There are 4 different local
#'s here but Earthlink wants us to use only the latest #. Each one has
differences such as:

Login:
login:
arc-10a.ocala login:
No prompts (for PAP I assume)
etc.

Also, Earthlink will change a lower case l to upper case L (or
visa versa) without notifying it's customers and I guess Stik is case
sensitive in this area.

Later,
John G.

I agree completely. I gave up on CAB myself and use IE, don't like it
but what else can one do, other than let the world pass you by.
I'm still amazed at what the authors have done with the OVL interface but
it has limits and CAB itself has other short commings.

Have you tried Stuffit Expander 4.5 along with "DropStuff with Expander Enhancer"? The latter is a separate shareware product and is needed to expand LHA (.lha, .lzh), ZIP (.zip), ARC (.arc), gzip (.gz), Unix Compress (.Z), UUencoded (.uu), MIME/Base64, and Tar (.tar) archives. The package works on System 7.1.1. or higher, and -- unlike newer versions of Stuffit Expander -- doesn't require a PowerPC processor. (Newer versions of Stuffit Expander have "DropStuff with Expander Enhancer" built-in, but since version 5.5 is PPC-only.)

I used 4.5 during my transition to the Mac, since most of my Atari archives were in LZH format. I recall having very few problems decompressing the archives, including proper folder structures. On a few occasions I had to resort to MacLHA or LHA Expander because Stuffit choked on the archives.

Both programs, Stuffit Expander and "DropStuff with Expander Enhancer" 4.5, can be downloaded at the bottom of this page:

Does anyone know or (even better) have the "Entwicklungs-Utility"
(Developers Utility) that must exist for the Print-Technik Universal
Scanner for Atari ST computers? It is mentioned in the appendix of the
manual for the software that came with my stone old Scanner/Printer. The
scanner software is from around 1988/1989 and is written by Roger
Bischoff. Anyone who knows or has the "Developers Utility" or who knows
Roger Bischof himself ?

In uno strano messaggio del 18 Jan 02 ellenkamp.guus@wolmail.nl (2:333/608.1)
scrisse al povero All :
eg> Where can I find an Atari TT? Preferably in The Netherlands.

Even if I am in Italy I would like to ask you how much would you pay for a TT
in a Tower case with perfect keyboard and monitor (and the original case) ?

I am trying to make an idea of its value tought it is not easy to sell it
here, there are much more Atarians in the central/north of Euroland.

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

Generally speaking, it's recommended to look for "ogin" ISTR.

Have you tried STiK with _no_ waitfor/respond sequences, just set it for a
PPP connection BTW?

Very interesting, my MagicMac manual does say to use 7.5 or 7.6. I have MagicMac 2.15, and it runs on Mac OS 8.1, although it exhibits occasional screen redraw problems. I haven't used it enough to have seen any other problems. Probably it would work better if I install OS 7.6.1? I have searched on the net for a list of features, conflicts, etc. on the various versions of MagicMac but haven't found any definitive information. I wasn't even able to find a list of what MagicMac 6 will do that MagicMac 2 won't.

I like that method, and I have all the necessary componets to do the same. I have wanted to get my Atari data backed up to a CD, instead of on magnetic media. One CD should hold everything I accumulated on an Atari from 1985 to 1997.

Bill

Look, if you are seriously considering having fun again, then I would
hope us in the Atari Community could do something to help.

I would offer my Falcon in a heartbeat, but as of right now the
powersupply is dead.

I do have a TT, but I think one with a Colour card would be better.

I have alot of Ataris but only one Falcon and One TT. There are some
here on this NG with more.

You made the right choice. It was a set back for us Atari Users, but
from a financial decision, you couldn't have left at a better time.
Just like you couldn't have chosen a better computer to develope on
15+ years ago.

Hallvard,

The Mac monitor isn't anything more than a relabeled VGA monitor with a weird connector on it? :) I don't see why it would not work. I have a monitor here that isn't even multisync and it works fine in ST low medium and high. The same principles behind mario becroft's vga adapter for st's (not the galaxy card, but just the adapter). You'd just need some sort of adapter for the mac video cable.

Hi Martin,

MT>Does anyone know or (even better) have the "Entwicklungs-
MT>Utility" (Developers Utility) that must exist for the Print-Technik
MT>Universal Scanner for Atari ST computers?
you should ask in a German newsgroup, for that scanner-printer was
sold a lot of times in Germany.

Only a couple of years ago, I noticed (a used) one at an 'Atari fair'
in Neuss, and it was to be sold by about 100 DM, if I'm right. As I
own a SCSI scanner, I was not interested in the Printtechnik engine.

I think it's to be connected to the cartridge port (ROM port in
German)?

It seems that MSDOS compatibility exsted in desktop's formatter of
TOS1.4 or so, but for some reason disappeared in TOS2.06 again!

However, TOS2.06 image can be edited to make the formatter DOS compatible
(it would still be as slow, though).

Hm, I think you are making things more complicated then they really are.
(Also this uue encoding really was not a very good idea as we are only
dealing with textfiles here)

Anyway after reading up a little on the Zetnet support pages I think you
may be able to connect with a much simpler DIAL.SCR compared to the one
you attached. I suggest you take a look att the Mac help for how to set
STinG up.

You do not need any dial script at all.

In the script I made I assume that Zetnet is capable of assigning you the
DNS IP-addresses automatically. Try this first and if it does not work
than insert them by hand.

Here is the dial script I came up with and I suggest you try this (after
entering only the ***** data off course) without any alterations first:

```
#
#
# General Parameters
#
SERIALPORT = Modem 1
DEF_ROUTE = TRUE
MASQUERADE = FALSE
EXEC_BATCH = FALSE
CIX_LOGIN = FALSE
RESIDENT = FALSE
DEBUGGING = FALSE
#
#
# Port Parameters
#
CLIENT_IP = 0.0.0.0
MTU = 0
PAP_ID = 1000****
PAP_PASSWORD = *******
PAP_PROMPT = FALSE
PROTOCOL = 1
VJHC = FALSE
```

```
LAN_PORT = FALSE
#
#
# Addressing
#
USERNAME = 1000****
FULLNAME = Andre
HOSTNAME = zetnet.co.uk
FETCH_DNS = TRUE
#
#
# Modem Specifics
#
INIT = ATZ
PREFIX = ATDT
HANGUP = ,+++,ATH
CONNECT_WAIT = 35
REDIAL_DELAY = 5
SUCCESS = CONNECT
SUCCESS = CDWAIT
FAILURE = BUSY
FAILURE = NO CARRIER
ABORT = NO DIALTONE
#
#
# Telephone
#
PHONE_NUMBER = 08440405910
FEE_FILE = LOCAL.FEE
ISP_TIME = 72, 0.07
ISP_SENT = 12288, 0.03
ISP_RECVD = 86016, 0.09
#
#
# Network Environment
#
#
#
# Dial Script
#
FIND_TIMEOUT = 60
#
DIAL_SCRIPT
#

End of DIAL.SCR

<snip>

Keep looking hard enough, I got my 1mb Falcon for £100, bought a ram upgrade card for £45 (14mb) then stuck in a 3.2gb hdd.

Having said that, I bought a external SCSI cdrom from Ashley about a year ago complete with cable for around £40 and it is still going strong so I would say it might be worth paying the extra as the item will have been well looked after.

no " l " ?

>Have you tried STiK with _no_ waitfor/respond sequences, just set it for a
>PPP connection BTW?
>

Sting has a "no wait" but I don't see it in Stik (PPP)!

I don't see why Stik can't find "login:" but will find "ocala login:"
even though the ISP prompt line shows "arc-11a.ocala login:".

What I have that works: (Stik PPP);

FIND = ocala login:
RESP = mine
FIND = Password:
RESP = mine

I agree 100%. Roger has helped me numerous times with quick fixes and
updates, sorting out problems with obscure drives and such. And not
only that, his software is top notch, with continual enhancements and
improvments. You couldn't aks for anything better!

>any file to the floppy???

That I can't tell you since don't have access to any versions of DOS,
except that hiding under Win98. What I think it is doing is spotting the
"MSDOS?.?" in the boot sector and, because 98 seems to like unique
serial numbers for all the discs it sees, it generates a new number and
writes it to disc.

In my experience, this appears to happen to every MSDOS formatted disc.
If I need to copy files from my Acorn machines to my PCs I format a DOS
disc on the Acorn. This ends up with the MSDOS 3.3 boot sector and, as
soon as it is inserted into the PCs floppy drive, 98 always modifies
these boot sectors, just the same as it did to DOS discs formatted on my
ST. Once the disc had the serial number written to it, 98 doesn't seem
to alter it again.

WinXP hasn't done this as yet and I don't recall noticing it happen when
I used Win95 or Win2K. Then again, I wasn't really watching for it when
I used 95, so it may have happened then. I've not bothered checking
whether WinME does anything since I don't often have to use the machine
it's installed on. I'll try to remember to check it out next time I'm
using it.

Thanks for the info!

I think I've gotten all the buttons and stuff working now, so there
shouldn't be any problems (except for this one that I know about, but
it's not a big deal.) Heh, I love my new buttons! ;-) Had to do a little
manual customization to get them to work.

Not really, it depends on the design of the fan/heatsink as well. Some
low-profile are just as good of big Athlong fans.

Although, I bet a Thermo-take 7200RPM fan/heatsink with a bit of Artic
Silver2 compound on the chip would keep the CPU temp down a lot.

Hey, Roldolf? Why not put a thermistor under the CPU on the board? It would
be good to be able to keep a track on the CPU temp

Hi Andre!

Your script is nearly identical to mine. However I can see two differences.

The first I don't think will make a difference, but you should change it. In the Addressing section you've got HOSTNAME = mail.zetnet.co.uk - this should be just HOSTNAME = zetnet.co.uk - ie without "mail."

The second I think is your error. You are using an actual dial script (the bit at the end), but the rest of the file indicates PAP dial in (which means the bit at the end is not necessary). Mine doesn't have this bit (see below).

Below see my entire SCR file (passwords etc hidden of course! :) Of course I'm on a Falcon, so I use Modem 2; you must be using an ST, so Modem 1 is correct for that. Also note that the phone number I'm using is different to yours, because I don't use the BT scheme that you have.

It sounds like a mix of the photocopies I got and the MSTe or TT
manuals, which had this TOS as standard (the desktops are virtually
identical apart from screen resolutions options).

This sounds like it was around the time that Compo got heavily
involved with Atari and cobbled various bits together.

Frankly, the mag reviews I used were probably of more practical use
than any manual you'd get.

That's true, but I usually grab newsgroups when I'm on a Web session.
I'm not linked to many active CiX areas now so I keep the message
reading seperate.

> I am still puzzled why some messages crash CixRead. It's rare,

Yup. I got it too before I decided to use the Tavern's usenet areas
with LED.

> What do you mean with CixRead not threading? If you mean putting
> topics together, though useful it doesn't worry me too much: I
> usually blink daily and then delete the read stuff, so it's not too

Well, you can tell I'm logging on about once a fortnight, so
threading's much more important to me. Newsie handles it pretty well
(but not perfectly and nowhere near as good as LED did).

> In any case the arrival dates seem a bit mixed up anyway, so I am
> not sure whether threading would sort this out.

It doesn't. That's just the internet's fault AFAICS.

> But as my son has just got a Freeserve account, I might try using that

Sure. You can run the two in parallel for a while and see which one
you prefer.

What do you mean, Hallvard? If you've installed the application so
that ZIPJR.TTP is called when you double-click on the archive, then
the file name is passed as the parameter. You don't call ZIPJR.

have I understood you correctly?

>were running Windows 95 at the time.

Hi Bob!

Actually I don't think Windows writes any extra *files*, but as it
has long file names (LFNs) enabled it does write both 8+3 and LFNs
in the directory and the latter look like files to the Aatri OS.
In fact they are the same filenames with one or more NULLs ($00)
between each character and a starting 'A' or up-arrow
(Char$(001)), plus some extra characters inserted which I don't
know what they mean. The extra characters also confuse the Atari
to show nonsensical lengths and dates.

The Atari does exactly the same as you describe under MagiC on
disks that have LFNs enabled. I have just made a test, copying
some files to both a normal Atari 8+3 disk and then to one having
LFNs enabled. The files were a good mixture of 8+3 and LFNs:

impressum.html
read.me
redaktion.html
index.html.

I show the two hex dumps of the directory below, with addresses
removed and spaces added between entries for clarity:

8+3 only (which truncates the names and extensions if longer)
========

49 4D 50 52 45 53 53 55 48 54 4D 20 00 00 00 00 IMPRESSUHTM ....
00 00 00 00 00 00 90 6C 2F 2B 02 00 C1 15 00 00 .....ê l/+..ê...

52 45 41 44 20 20 20 20 4D 45 20 20 00 00 00 00 READ ME ....
00 00 00 00 00 00 F4 B3 63 2B 0B 00 45 03 00 00 .....êê c+..E...

52 45 44 41 4B 54 49 4F 48 54 4D 20 00 00 00 00 REDAKTIOHTM ....
00 00 00 00 00 00 A9 6A 2F 2B 0C 00 EE 0E 00 00 .....ê j/+..ê...

49 4E 44 45 58 20 20 20 48 54 4D 20 00 00 00 00 INDEX HTM ....
00 00 00 00 00 00 9A A1 30 2C 1F 00 98 0B 00 00 .....êê 0,..ê...

The 'foreign' characters below each filename are the ASCII equivalents
of the length and timestamp data.
Note that there is no dot ($2E) between filename and extension (you
have to look in the Hex portion as file dumps tend to use dots for
NULLs in the ASCII part of the display).

LFNs enabled (which shows both LFNs and 8+3 abbreviated entries)

The tilde (~) characters indicate where long filenames have been
abbreviated for 8+3 OSs, and they are shown in that way in an 8+3
directory on the desktop or file selector if LFNs are *not* enabled.
Again the 8+3 names have no dots between name and extensions, but the
LFNs do - they have to as the system doesn't know how long the name is
- and it may even contain several dots and/or spaces!

As an interesting sideline, when I copied these 4 files with Kobold
(either from Thing set to use it with more than 3 files, and also by
starting Kobold directly) index.html was copied as INDEX_HT.ML! This
was repeatable, so aparently a flaw in Kobold 3.5. Copying the files
singly from the desktop worked OK.

>and high.

Are you sure it's not a Multisync? I've never heard of anything
but a VGA monitor that would do ST low and medium, since these use
TV scan rates - 525/60 in NTSC countries, 625/50 in PAL and SECAM.
In both cases the horizontal frequency is around 15 kHz+ and
normal VGA monitors won't go below 30 kHz. The different frame
rates are easier to accomodate.

Actually Simon,
```

The 060 has two built in temperature sensors so I don't know why a thermistor would be necessary, would it produce better readings?

try this:

< http://home.tiscalinet.ch/donze/software/index.html#ZIP>

This is a part of ZIP 2.30 and UNZIP 5.40 R2 and works fine under MagiC.
Philipp Donzi¿½ make this Atari part of Info-Zip.

It is just another bus standard, along the same line as ISA or PCI busses found on PCs. VME has mostly been used on industrial computers and since Motorola (who manufactures most of the chips found in Ataris) also makes VME products, Atari decided to include such a bus on the TT and MEGA-STE.

So far, cards which offer drivers for Atari (either for TOS, MiNT, STinG or Magic) have included:

* graphics card (Crazydots, Nova, AlberTT, etc.)
* Ethernet card (Riebl, PamsNET, etc.)
* GPS-based reference clock

Currently, the only available VME product for the Atari is Mario Becroft's work-in-progress, the Galaxy Ethernet/graphics combo card. See:

http://gem.win.co.nz/

Noticing the recent volume of VME-bus related questions, I will be adding a new section to the page whose URL appears below (Atari ST Quick FAQ improvements are also upcoming, now that I got connected at home over broadband and can upload more freely).

Hi, Donner,

NO, the EXE file extensions means it (usually) it's a program file. If it's supposed to be a graphic, my best guess is it is a self extracting file of some type. But it could also be a program file such as a PRG, TTP, or TOS is a program file on the Atari.

I can't think of a logical reason to do that with a JPG since the resulting file would be larger than the original JPG.

Sorry, it must be versions above 5.5 that are PPC-only.

<snip>

Download version 5.5 of Stuffit Expander and "DropStuff with Expander
Enhancer"; install the package then delete 4.5 (or vice versa). I would
have recommended 5.5 in the first place but thought it was PPC-only. You
can get it here:

http://www.vector.co.jp/soft/mac/util/se036083.html

> The problem is that for "Internet Config" I'd need an example file, or
> the 4-character code for a .LZH file to be owned by Stuffit Expander
> 4.5. Do you happen to know that?

I never tried this while using 4.5. But I just tried 6.0, using Mac OS
9.2.2, on a manually modified LZH archive:

Type: BINA
Creator: SITx

I get a Stuffit icon, and when it's double-clicked Stuffit Expander
automatically decompresses the file.

If you have oodles of files and want to automatically change the Mac's
Type and Creator codes, I recommend FileTyper:

http://www.ugcs.caltech.edu/~dazuma/filetyper/

> Also, for Netscape: how should I defined a new MIME type for .LZH?

As in a previous thread, I believe your problems are related to some
mis-configured servers not knowing what an LZH file is.

Anyway, if you want to experiment with things, enter the following in Internet Config (now called Internet Control Panel since IC was later incorporated into Mac OS):

Extension: lzh
Description: LHA Archive (or whatever you like)
MIME Type: application/x-lzh
Select "Map Incoming" (file mapping will be applied to incoming files, thus the Type and Creator codes listed below will be added)
Default Format: Binary Data
Handled by: Application (choose Stuffit Expander, which will automatically decompress the archive after the download is complete) or Save to File
File Type: BINA (i.e. binary)
File Creator: SITx

I don't think Netscape uses Internet Config, so you'll want to choose Preferences>Applications and modify the browser's internal file mappings. Use the suffixes "lzh,lha" (no quotes), and set the other parameters using what's listed above as a guideline. I don't have NS 4.08 on my machine so YMMV.

For all this to work when clicking and downloading an LZH archive, the server will have to send out the MIME type listed above. I could be wrong though. Even if you configure things correctly, Netscape may still be wonky when it comes to some servers.

I have Internet Config set up as listed above but with no MIME type specified, and the LZH downloads in IE -- which uses IC -- are fine, including the new File and Creator codes. Some servers send out LZH files as application/octet-stream, so maybe it's best to leave the MIME Type field blank. IE must base the download on the extender itself, not what the server says the MIME type is.

You can run Stuffit Expander and automatically configure it (via preferences) to update IC with the mappings that Stuffit supports. But because Netscape doesn't use IC, it's not going to help at all. However, if you use an FTP client that supports IC, you should get an LZH download with the proper File and Creator codes (a double-click away from decompressing).

Experiment with Netscape's internal file mappings... but don't be surprised if you still have trouble with some LZH downloads.

Hi,

I just bought a second hand Mitsumi FX001 CDrom drive, with an Overscan Rom port cartridge. This CD rom player is connected to the Atari ST through the ROM/Cartridge port. Unfortunately I have no driver software for it. The interface is manifactured by Overscan (Atari oriented company from Berlin) .

Is there anyone who has the CDROM driver for me?

Thanks,

Marco

There is nothing wrong with that archive. If one take a closer look at
the link of that archive on the ftp-server one will see that it's in
fact a symbolic link toward /mint/archivers/
These files are only usuable under MiNT.

CU,
Martin

One good reason. STZIP contains more bugs then my wallet money. I really
can't recommend anyone to use STZIP.
If you want a reliable archive use LZH. The only drawback of LZH is that
many pc-users can't handle LZH.

CU,
Martin

>I used an NEC Multisync II monitor years ago, and it wasn't nearly as
>sharp and clear as the SM-144 I now have, even though it could handle
>the same frequencies.

I recently acquired a NEC Multisync II myself, and would like to
replace the pair of SC1435/SM124 currently taking up a lot of space
on my bench. The NEC may not be as sharp as a really-truly monochrome
monitor (which is optimized for its single scan rate, without having
to compromise for flexibility like all multisync monitors do), but
the convenience of having one monitor capable of doing the entire
job (abovementioned flexibility) is very appealing.

Are there plans for building a ST-to-NEC II adapter anywheres? Since
you say you had one, do you still have this information about?

You are right, but what we sould use?

LZH looks pretty good, but it produces larger archives as ZIP.
Any other bug-less ZIP isnï¿½t avaiable?

For personal use I always use tar and gzip. If I must share the archives
with other then I make use of the latest zip.
>
> LZH looks pretty good, but it produces larger archives as ZIP.
> Any other bug-less ZIP isnï¿½t avaiable?

There is.
ftp://chapelie.rma.ac.be/atari/archivers/

-rw-r--r-- 1 ftp 148111 Jul 13 2001 zip23_02.zip

For more info see the homepage of Philip Donzï¿½
<URI:http://home.tiscalinet.ch/donze/software/index.htm#ZIP>
Whilst you are there you can grab Arcview. As shell it's maybe not so
nice as STZip but IMHO it works great

417. NVDI and TC6100 graphic card

Newsgroup: comp.sys.atari.st
Date: 2002-01-20 11:06:19 UTC
From: gregory@PLEASe!dELETE.atari.pl
Message-ID: <a2e8b6$7uh$1@news.tpi.pl>
Source record: 38771

Hi,
Can I use MagicVME graphic card (with *TSENG TC6100* chip)
on my TT with NVDI 5 and MagiC 6.2? Will I have to use
vmg-4000.prg (from NVDI package) to make NVDI work
with that card? In the text files it is written that
this program is for VT4000, and TC6100 is not mentioned.

I am asking because I don't know if I should buy that
card or not. I cannot resign from using NVDI, because
I need vector fonts and printer drivers.

Thanx in advance for any answer.

No, it's connected to the printer-port. But there was once an interface to
connect it to the cartridge (ROM)-port. But it works on my printerport on
my ST.

Does it? My experience is that LZH makes smaller archives than ZIP. That's also what I raed in a test in an Atari magazine many many years ago, when that magazine (START, dutch) still existed (sniff..)

> Any other bug-less ZIP isnï¿½t avaiable?
I use the SpareMiNT version of ZIP. But not everyone has such a unix-like MiNT setup in his Atari.

>Cheers!
>
>James

Just for clarity, I'm using Stik2 (203) with Dialer .53.
It was explained to me that the reason Stik2 could'nt find the word
"login:" prompt is because there is now a space before it. So when I put
"ocala login:" it included the space so it could now be found!

>So I tried another unzipper called "UNZIP540.TTP".

This is from the "InfoZip" package, and probably THE universal unZipper to use, because that same Zip/Unzip package is available for practically any computer platform existing and it is still being developped.

Besides, InfoZip package has some rather nice and unique options, such as repairing a damaged archive (option in ZIP.TTP), splitting the archive into smaller ones (though still not making a multi-volume archive; they are supposed to work on it), saving file attributes (on systems which have them), etc.

(Btw. it looks like updates of Atari ports of Infozip pack- some of them made in the last year or so- do not get back to InfoZip to be included in the source archives- which is a pity; what they have on InfoZip concerning the Atari seems rather old- but I may be wrong here).

Be careful, there were two independent recent ports for Atari: one -requires-
Mint (why, in heaven's name, for a universal application like that?) and one
does not (which shows it can work in a much simpler setup). You probably were
unlucky to get the one unsuitable for your working environment.

>The "UNZIP540.TTP" that I got from this other Atari user on the other
>hand seems to work, but I'd really like to get the whole archive. Anyone
>know where it can be found?

AFAIK the pack which works in plain TOS contains only ZIP and UNZIP, but
not ZIPNOTE, ZIPSPLIT and ZIPCLOAK. The one requiring Mint seems to have
been done more thoroughly and contains everything it should.

I may have some docs to send to you, look into your email these days.
There is a chance that you already have those files, but then, there
may be something of value to you there.

>Has someone compiled an Atari version from the
>sources unofficially and not made it publically available?

It (they) has been made publicly available but, apparently, not fed-back
to InfoZip archives, the way they should have been.

Btw. in the port which doesn NOT require Mint there seems to be a bug which
affects listing of the archive directory to screen- lines get overwritten.

>
>>PPP connection BTW?
>>
>
> Sting has a "no wait" but I don't see it in Stik (PPP)!

IOW, don't have any FIND/RESP sequences - comment these out with a "#"

>FIND = ocala login:
>RESP = mine
>FIND = Password:
>RESP = mine

Again, sometimes it's better to just look for "word" rather than enter the
whole string if you actually need this sequence. If your ISP decides that
they'd like "password" rather than "Password" then you'll be st*ffed.

Anyway, if it works...

AFAIK at least some of them axist as separate programs (step rate, arrow-fix,
newdesk-buffer...) which can be put into AUTO folder.

>Would any such "fixer" program take up additional memory of the
>computer, or are most of the fixes made up in the way that they just
>change some settings which are incorrect in TOS, then exit? Sort of like
>flipping some switches.

I am afraid they are new routines which replace the buggy ones in TOS,
so they will permanently take some memory.

>It would be nice to fix those bugs here and there, but it'll probably
>take a whole lot of effort to figure out exactly how to do it.

Not exactly, you go through the command file (F206_REL.FIL, IIRC), edit
the location of the original TOS image file, and then enable/disable
sections for the patches which you want. Then you start the patch program
and feed it the name of the command file. The result is a modified
TOS image file.

>It would probably take a little
>longer to boot the machine this way, but a lot easier (and more
>accessible to most people) than actually burning new EPROMs.

An edited TOS2.06 image can also be loaded into RAM- I use it that way all
the time. True, it takes a considerable amount of memory (cca 300KB),
but at least you would be able to see if the improvements are worth further
consideration- and to test everything before actually burning EPROMs.

Agreed, but I've run into a problem with deleting individual files from ZIP archives with Arcview. In the VT52 window I get this error message:

---

zip I/O error: invalid drive id.

zip error: Temporary file failure (zi118000)

This function seems to work fine with LZH files, and used to work fine until I upgraded to MagiC 6.10/6.20!

Anyone any ideas please?

> After copying some files to a PC at work I found the disks were
> completely inaccessible on their return to my TT. It was impossible
> for me to indentify the cause...

Were you able to format them on the TT?

I've experienced a high percentage of 3M brand HD disks employed for transferring fies from PCees to my TT that went bad. Seems strange that anything could be written on a disk that would make it resist formatting. I'm inclined to think that they were just poor quality disks, except that I haven't had a high failure rate on the same brand disks when used exclusively on the TT. If I make 3 or 4 attempts they will sometimes make it through formatting, but they are too unreliable to risk using. After a lot of experimentation, I finally decided that if a floppy shows any sign at all of a problem, I just toss them out. It's not worth the time spent fiddling with them, or the risk to my data.

A lot of my older Atari DD disks are also turning out to be hard to read reliably. Floppies are not good for long term storage.

I gave up on Syquest Syjet as too unreliable, after having three of them go bad. I've also seen a lot of reports saying the Castlewood Orb drive is another a dog to be avoided.

The only long term storage I trust is a sealed hard drive, a CD-R, or a Syquest EZ135. I've only had the CD-R for a year, so I'm relying on claims that the disks will hold up for at least 10 years. The EZ135 is probably not safe either, although I've used two drives and about 20 cartridges for 5 years now and only had minor problems.

Ah. I thought so!

>So to summarize, the frequencies which a monitor needs to be capable of
>is as follows:
>
>"Low": 50Hz vertical (European STs), 15KHz horizontal
> 60Hz vertical (USA/Canada/Japan STs), 15KHz horizontal
>"Medium": same as above
>"High": 72Hz vertical, 15KHz horizontal (?).

More exactly the quoted 15 kHz should be
15.625 kHz for 50 Hz and
15.75 kHz for 60 Hz

(just a product of 625/2*50 and 525/2*60 -- the '/2' is because
the horizontal line number includes interlace)

The High rez. is actually 500*71.4 = 35.7 kHz, which is why it can
be shown on VGA monitors. Monitors are usually specified only with
the product frequency.

Note that in both cass not all lines are visible - some are needed
for overscan and flyback. Thus the SM124 can display 400 lines
normally or 480 lines with overscan modification from the 500.

Some of this info is from Mark Baines' /The Atari A-Z/. He also
says that the TT uses 60 Hz for colour modes and 67 Hz for mono.

>Assuming it's correct, one just has to check if the specs of the monitor
>match the above, then wire it appropriately?

Yep.

>Of course, how the display output actually is (grainy or clear, sharp
>display) is another matter entirely.

No monitors should be 'grainy'. Sharpness depends on focus and
contrast adjustment, pitch of the shadow mask (colour monitors

only) as well as brightness settings (some monitors and TV sets have poor EHT regulation, so if you turn up the brightness the spot size increases, giving less sharpness).

>What exactly makes the SM-124/125/144 hires monitors so good on the >eyes?

Fine-grained, high contrast phosphor (which is why it only shows mono - a pixel is either on or off), good EHT regulation, and the higher refresh rate.

Having said that, I now use a very old IBM VGA mono monitor that someone threw out, and that is nearly as good as my SM124. Has the advantage that I can run it in 640*480 and in greyscale as well, useful for viewing web pages. Normally I stay with mono as it speeds up the display considerably. I think it is quite similar to the SM144, which was not a 'real' Atari monitor but brought out by some distributors as a replacement.

>I used an NEC Multisync II monitor years ago, and it wasn't nearly as >sharp and clear as the SM-144 I now have, even though it could handle >the same frequencies.

No, the shadow mask and use of three beams reduces sharpness, specially if they are not converged correctly (mainly in the corners). Actually my old Philips CM 8852 colour monitor has a button to switch off the red and blue beams, leaving just a green display which is sharper for text work etc.

>Were the Atari hires monitors somewhat custom-made? If modern VGA >monitors can't replace them, what can?

I think they were produced by a couple of firms as a special order for Atari. As I said, a VGA monitor works fine at high rez., which is all I normally use. I switch to the Philips when I want low and med rez. colour, though I have purchased an SVGA to allow higher colour resolutions, though I haven't set it up yet due to lack of room on my desk.

>Any other bug-less ZIP isn't avaiable?

Robert,

I can't agree with you there. I have made many tests, and it seems to depend on the file (probably its type) - sometimes LZH produces smaller files than ZIP, with other files they are larger. I like ZIP because it's easy to add comments at the start, and as you say LZH is hard to handle on PCs. Personally I have had few problems with ZIPJR.TTP in 2-in-1, though I have heard that very large files can give trouble. I believe the latest ZIP23_02 is better there.

Hallvard had a bit of a problem with a large ZIP/MIMed file I sent him, but that seems to have been due to something connected with transmission as the message got split into two parts. (Of course ESS-Code can be set to split a file this way during MIMe encoding, but I did not do that, so it's a bit of a mystery).

Regards, /Peter/

>(there's always a BUT!) I can't find any option similar to "-g" as with
>ZIPJR.TTP.

If you do as I do, put UNZIP540.TTP in its own folder (I call mine
2_UNPACK), possibly with MUNPACK.TTP as well to handle unMIMing,
then copy the ZIP file to this folder and drag it onto the TTP,
it will decompress in this folder. You can then move the
uncompressed data anywhere you like and delete the ZIP. Make the
TTPs read-only so they are not deleted accidentally!

>So now I have one program which creates a new folder for the ZIP file,
>but decompresses *all* .ZIP files available,
>and another program which only decompresses the ZIP file which has been
>double-clicked, but doesn't create any new folder. Argh!!!!
>Anything else I can try?

Only a shell, like 2-in-1 or ZIP's own shell, which allows you to
choose which files and/or folders to extract, as well as their
destination path. You can set the parameters in this to decompress
to folders or not, as you like.

I've installed 2-in-1 on an Alt-key combination (actually Alt-2 as
this is easy to remember) and set the default paths to my 2_UNPACK
folder on one side and the drive where I normally want files to
decompress to on the other, so it's nice and quick to use. Of
course you can alter the paths with a click or two should they not
prove suitable at times.

Hi Grzegorz,

GP>Can I use MagicVME graphic card (with *TSENG TC6100* chip) on my TT
GP>with NVDI 5 and MagiC 6.2?
I think it's worth a try.

GP>Will I have to use vmg-4000.prg (from NVDI package) to make NVDI work
GP>with that card?
I don't know if there was a TSENG chip 'better' than the ET-4000 when
the appropiate NVDI was produced.

Notice there has been no difference between the ST, MagiCxx and TT
(graphics card) versions since a number of updates.

GP>In the text files it is written that this program is for VT4000, and
GP>TC6100 is not mentioned.
You may try, but be careful when using VMG-4000 and begin with
'harmless' resolutions.

Could you please give some more details about that TC 6100 card? Was
it developed for use in Atari computers or just PCs?

If they are, change the extenders to ZIP and then have STZip (or whatever you use) have a 'go' with them. You might get lucky and have the file's embedded executable ignored, going directly to the ZIP data. This worked for me on a number of occasions.

In the installation menu you should select
Arguments: -e
Document type: ZIP
That should work, if I remember, both with zipjr and stzip. Double
clicking on a ZIP file to extract it should be possible. I remember I have
done it in the past, but I'll test it again these days. What you're
looking for shouldn't be a problem.

Ignore my previous message. It's not correct. The argument should be -x
for ZIP, and x or e for LZH. But even then it doesn't work on my desktop
either. I can't remember why and how it worked for me in the past. I never
use it that way anymore: It's always a good idea to look into the
contents of an archive before extracting it

455. Falcon Icon Scrambling Problem

Newsgroup: comp.sys.atari.st
Date: 2002-01-21 10:34:42 UTC
From: purpletwilight3000@yahoo.co.uk
Message-ID: <2bfabd3.0201210234.2068d7b5@posting.google.com>
Source record: 38707

Anyone know what this is? For as long as I can
remember my Falcon has shown icons 'scrambled',
ie the contents is noise. All other items,
menus, etc show normally and the Falcon works
normally. If I install NVDI the problem
goes away and everything works fine - icons
are shown properly, etc.

This particular Falcon has quite a bit of
modification including a Nemesis accelerator,
and I just wondered if there might be a loose
connection somewhere?

Out of interest I managed to get my Falcon working with a Tiscali
account (10 quid for 100 hours a month) by simply modifying an
existing STIK (old version) script. It took minutes to do and apart
from an occasional failure to initialise I've had no problems.

Best wishes

457. Calling all gurus: Converting Atari/Spectre/Mac database to PC (Excel)?

Newsgroup: comp.sys.atari.st
Date: 2002-01-21 10:45:08 UTC
From: privacy_101@hotmail.com
Message-ID: <cb21d812.0201210245.239cce68@posting.google.com>
Source record: 38709

Hi all,

Short version:
How can I best convert my old (MSworks on spectre)atari database to use on a PC with MS excel?

Long version:
Ive got this database I made years ago. It's on an Atari, running Spectre, running Mac system 6.x(?), running MSworks (the spreadsheet section).
Im trying to get it to end up on my PC in Excel.

On top of the issue of database conversion(ie MSworks->MS Excel), theres the problem of the type of disks the database is on (Atari/Spectre formatted -> PC formatted)

The best plan so far seems to be to get the database onto a Mac first, and then use File Exchange to get it onto a PC.

I used the 'ghost' copier program (Atari, made by some french guy, not the Symantec(sp) version) to simply copy the database from the Atari/Spectre disk to a Mac disk. Trouble is, the Mac disk can only be formatted as a single sided (double density) disk (like the Macplus etc had), and modern macs only read 1.4 mg floppies.

So at this stage I'm looking around for someone who has like an old Macplus that will read single sided disks, and then copy it to a 1.4 mg newer disk that a modern mac (one with File Exchange) will be able to read.

I invite comments and feedback on what i'm doing.
Am I missing a simpler solution?

any response appreciated,

Andy
ps. There's an export button on the 'save as' box(in MSworks), but it doesnt seem to do anything.. so im not even sure that once the database is on a modern mac with file exchange, whether any other prog will be able to read it (Mac, or PC).

No expert in this area, but it sounds like the system palette might
be wrong for the colour icons you are using. Most conversions of
icons for the Atari these days are adjusting to the NVDI palette
actually. (Same palette is used when you start eg. CAB, IIRC)

Solution could be to save palette file (from CPX I think) when you have
NVDI loaded. I suppose others are around to give a more in depth
explanation of this...

I am still looking for John Richardson, who modified the "Semper" mailer to make it work over telnet connections. Noone of his email addresses do work, but I found with google he wrote few messages here last yer, even if never specifying his email address.

So please if anybody (ex NeST sysops?) can give me any info, please help me get in contact with him, some of his old addresses where:

j_richardson@tinyworld.co.uk
john@jr-enterprises.co.uk
Illumuninator@aol.com

Just consider he wrote me on 16 Jan 00:
I> So sorry Mike, I've been working the the last weekend. I'm off mon/tues
I> this week I'll definitely send it tomorrow.

And then stop 8^(

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

Hi Martin,

If you mean the driver for enabling Calamus 1.09n and MegaPaint Pro 4 to
scan directly from the scanner, then, yes I think I have it. The scanner
heat roll copier may be old, but it's built like a tank and
ultra-reliable and perfect for running off copies of maps to the umpteen
lost drivers who knock on my door. I use a Mac now and so will have to
connect up my Falcon set up to check and send the software to you if I
am correct.
Keep your fingers crossed.

462. [help]Drag and Drop protocol

Newsgroup: comp.sys.atari.st
Date: 2002-01-21 13:34:09 UTC
From: lafabrie florent <lafabrie@club-internet.fr>
Message-ID: <3C4C18D1.4080706@club-internet.fr>
Source record: 38714
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

Icon Extract version 1.3 advance, and now that the long filenames are managed correctly (thank you Eric) as well as the XPM files, I attack the Drag Drop protocol to Interface or RSM. I have a small problem when I do a call of Drag Drop with the source code in C liveries in the documentation of Magic 6. There is what it happens:

1 - I displace my RSC file by a graf_dragbox () toward an empty window of Interface.
2 - I detect the handle of the window by wind_find () and the ap_id of Interface by wind_get(WF_OWNER...).
3 - I open a Drag protocol Drop by the call ddcreate () and I get the handle of the pipes (example: 6).
4 - I do the call ddrtry() to read the 32 supplementary bits of the pipes.
5 - At this moment, the call must send back me 1 if all passed well either himself 0 in case of mistake. But visibly I have no return! The routine seems blocked at the time of the reading of data. I can displace the mouse, I have clicks to the keyboard when I push over, but no access to windows and to the menu. In short it seems well being a crash.

What I would wish, it's a skeleton of a program or examples using the source code of Magic. Thank you by advance of your help.

F.LAFABRIE

I take it this is the original Spectre program, not Spectre GCR?

> On top of the issue of database conversion(ie MSworks->MS Excel),
> theres the problem of the type of disks the database is on

Excel usually reads a Works file. The question is, will today's Excel versions read a Works file that old?

> The best plan so far seems to be to get the database onto a Mac first,
> and then use File Exchange to get it onto a PC.

Modern Macs do not use File Exchange. The ability to read PC floppies is built into the operating system. My mother's old Power Mac 6400 will read PC floppies I know for a fact.

If you can get the file onto a Mac formatted disk the real Mac can read, all you will have to do is copy the file from the Mac floppy to the Mac hard drive, remove the Mac floppy and insert a PC floppy, and then copy the file to the PC floppy.

> I used the 'ghost' copier program (Atari, made by some french guy, not

I don't have a Mac, but I do have Spectre GCR running and dBase Mac installed there.

I think you're right. The blitter didn't work at 24MHz on my Falcon
either, with the same results as described above. It should work at 16 and
possibly 20MHz though.

Being a dedicated Mint user this is for me not a problem ofcourse.
MagiC- and plain TOS users can make use of the latest ZIP tools. Nothing
holds then to use these tools in conjunction with for example Two-in-One
or with Arcview.

I thaught MIDI cables could max be 7 m. Can't confirm this, but that's what
i've heard from the store who sells them...

> you network a MiNTnet side to a STiNG side on the other?

Yup, that's possible. Just run on MiNTNet the BNET-server (MagicNet) and the
client on your STiNG side. This should work. If you run single TOS on the
STiNG computer, be sure to read the docs... thaught you had to run is as an
acc, if i'm right.

Hi All

This has probably been asked before:

I am using a VGA monitor with my TT. However, I have borders on each side. No amount of fooling around with the monitor controls can make it go so I am using the full extent of the territory the monitor can provide.

Is there a solution?

My Falcon works Fine on it, but with the TT, I have these borders to deal with.

any suggestions?

HipCrime offers a new service: Custom massive spamming, FREE.

Just post a URL to Free.HipCrime, and a "joe job" spam will be
conducted via both Usenet and Email. Your article will appear
in _every_ newsgroup (even moderated ones), and it is protected
from the filters and cancelbots by the latest in hash busting &
cancel preempting technology. Plus, your message will be sent
to many millions of emails (direct from closed, non-blacklisted
mail servers).

This will give you the best of both worlds: gigantic growth
in your site's traffic, combined with "plausible deniability"
with regards to any complaints.

Your site will become "internet famous" overnight, and a critical
mass of visitors will make it a "net hot spot" for years to come.

Got doubts? Just check with some of our happy customers, whose
traffic rates have recently shot through the roof, for example:

http://www.osearth.com
http://www.careermd.com
http://www.dolphinwave.org
http://www.spamhunter.co.uk
http://howardk.moonfall.com/

Hello everyone,

After attempting to connect a new 1.28GB harddrive to my Falcon (did I get a bad one, or do the Quantum Fireball units all sound like a jet taking off? -- very loud!), I had a bit of trouble with NVDI 4, so I installed NVDI 5 on the new harddrive.

My HP 610CL printed fine, but my Epson 740 printed nothing but gibberish. I've now switched back to my nice quiet older harddrive with a nicely working NVDI 4, but I'm wondering if anyone uses NVDI 5 with the Epson 740 printer. If so, how?

>folder XXX" (which essentially creates a new folder with the same name
>as the zip file which is great in case the file doesn't contain a
>folder!).

Isn't that what the 'g' switch does?
The 2-in-1 setup (Options ZIP) says: 'g Extract archive X to folder X'
while ZIPJR itself says:
'-g extract files of FFF.ZIP in subdirectory FFF'

I guess '...to subdirectory FFF' would be clearer there :-)

You can get a list of all the switches if you type 'h' or '-h' in
ZIP's command line.

HTH

>above "High" (black/white): 72Hz vertical, 35.7KHz horizontal

Near enough, though as I said most monitors are usually specified
only by the 'product' (lines x fields) frequency - most modern ones
work from 30kHz upwards. The vertical rate is not normally a problem.

>The 50 and 60Hz rates for the colour modes, are they determined by the
>frequency of the AC voltage frequency used for that country? Naturally
>there are more countries than the above where people have STs.

They were originally, in the mid to late 1930s when 'high
definition' (as it then was!) TV systems were specified. In those
days the EHT for the tube was derived by a transformer from the
mains, and as large high voltage capacitors were rather expensive,
they tended to use too low a value to provide good smoothing. The
result was a moving 'hum bar' which was far more annoying than a
stationary one. Therefore the vertical scan rate was locked to the
power grid frequency, and though the hum bar was still there, it
was not readily apparent.
For many years now EHT has been derived from the line flyback
(much cheaper and safer) so that reason no longer holds, but they
obviously didn't want to change the standards more than necessary.

In fact, NTSC now has 59.93..Hz vertical scan, to make it an
integral submultiple of the colour subcarrier - again to prevent
visual interference. Or to use the official lingo: 'The colour
subcarrier frequency is 3.579545MHz, which is an odd multiple of

the line frequency in order to cause the minimum interference to
the picture when the signal is displayed by a black and white
receiver.' And of course the frame frequency is 2/525 of the line
frequency. So the product is nearer to 15.73kHz rather than the
15.75 I quoted earlier.

>My next
>guess would be PAL or NTSC differences, but of course this has nothing
>to do with the *video* output, but the RF output from those machines
>with an RF modulator, or am I completely at loss here?

Strictly speaking you are right, but the common practice is to
call 625/50 PAL, and 525/60 NTSC, though as you say these *really*
refer to the modulated signal for RF output. In fact at least one
country in S.America (?Brazil?) uses 625/60 PAL and there are some
that use 625/50 with NTSC coding! On top of this there is SECAM,
now confined to France and French territories and some parts of
the Middle East, but used to be used in Russia and many Eastern
Block countries. From the pure video point of view this is 625/50
like PAL, but coded differently for composite video. Nasty system
- can't be mixed as video! (Doesn't matter now that component video,
analog or digital, is used in TV stations, but used to be a major
headache.)

But the best results will always be obtained with *uncoded* video,
such as RGB, which the Ataris offer. Composite video is a second
best, and is TV-system-specific.

>> The High rez. is actually 500*71.4 = 35.7 kHz, which is why it can
>> be shown on VGA monitors. Monitors are usually specified only with
>> the product frequency.
>
>What's the number 71.4 for? Comparing with the same equation for colour
>modes it seems that the vertical rate is 71.4KHz and not 72KHz as I
>assumed?

71.4 Hz *not KHz*!!! But yes, that is the accurate value on
European Ataris at least. Not sure about US ones, but probably the
same. In any case monitors should tolerate slight differences -
it's only when you try to film or video off-screen that 'shutter-bar'
effects appear!

<pedantic mode>
BTW, note that the correct 'kilo' abbreviation is a lower case 'k'
and not 'K', which stands for Kelvin - the absolute temperature
scale. So it's xxxkHz, not xxxKHz. I know it's inconsistent with
'M' for mega, but then 'm' is already in use for milli (1/1000).
The logical thing would be for multipliers larger than 1 to be i
upper case and those smaller than one in lower case, but nobody's
perfect - not even the internationally recognized abbreviations
:-)
<pedantic mode/>

>> Note that in both cass not all lines are visible - some are needed
>> for overscan and flyback. Thus the SM124 can display 400 lines

>
>Unfortunately not with an STe as I have.

I *think* that there was an overscan mod available for the STE,
but have no experience of this.

>The limitations above are for the two colour modes then?

If you are being exact, then no - it's the two TV systems' scan
frequencies :-)

>Good quality in other words? No special design like I was wondering
>about?

That's about it.

>So there are actually non-Atari monitors out there which can fully
>replace the original SM-1xx monitors?

They can on the Falcon, but I see no reason why they shouldn't
work on an ST/STE as well. If you can still find an old VGA mono
monitor, you should get it for peanuts (mine was thrown out with
an old PS/2 IBM system).

>I've never tried connecting a standard VGA monitor to my STe or Mega
>STe, so what kind of output would one expect from that?

Not as good as a mono monitor - see below.

>Are you saying that a colour monitor just can't give the same sharpness
>as a dedicated mono monitor (such as the Atari SM-1xx) can?

Yes, exactly that. A mono monitor uses a continuous phosphor
coating. A colour one uses dots or lines of phosphors in 3
colours, plus a shadow mask to ensure that each beam only lands on
the correct phosphor. This breaks up the image, as you can see
clearly if you look at the screen with a magnifier. The result is
that the edges of letters, as well as other objects, are not as
smooth.

>Hmmm... this is worth noting as I'm looking into several video ouput
>solutions for my rack mounted STe. I was also thinking about adding
>potmeters for the 3 colours, assuming that this would effect the colour
>balance in high mode, so I could get an old fashioned orange or green
>display (remember them?).

Yep! The orange ones were normally long-persistence phosphors so
that they wouldn't flicker. Not very nice with moving objects!
But it should be easy enough to bias off the blue and red guns to
get just green - just switch a high enough negative voltage to the
control grids until the respective beams are cut off; no idea of
value, and note that the grid may be at a high (negative)

potential to earth in some cases - namely those where the screen
is earthed and the cathode is at negative EHT potential so that
less dust is attracted to the screen.

>But that's the mono VGA monitor you mentioned above, right?

Yep.

>I'm guessing that a standard, modern VGA colour monitor won't give as
>good a picture as that (hoping that I'm wrong of course)?

It's not likely to, though if it has a much larger screen you may
not notice it too much - depending on the screen resolution you are
running, of course. Not that you have much choice on an STE unless
you run MagiC (not sure even in that case).

>How good a display will one get with an appropriately made cable or
>adapter in "high" mode compared to an Atari SM-1xx?

Reasonable, but on a colour monitor not as good as on a mono one,
as I said.

>(One of those flat screen LCD monitors would be great!).

Yes, my son has just got a 15 inch one (picture size equal to a
17" tube) with his PC. This was a special offer from PC World with
a 1.9GHz Pentium 4, CD/DVD drive, CD Rewriter and floppy drives,
3 USBs and various other ports (inc parallel and 2 serial), all
for a penny under 1000 pounds. Seems quite a bargain. Haven't
tried the screen with the Falcon yet :-)

Regards, /Peter/

> probably self extracting Prg files...

I agree with that.
Note, though, that it may be possible to load the EXE into STZIP to
extract it, in much the same way that you can load a self-extracting
TOS file into it. Give it a try.

>> I can't think of a logical reason to do that with a JPG since the
>> resulting file would be larger than the original JPG.

This is true, but there may be a good reason for this. For example, a
JPG would normally load directly into a browser window, but because it
has to extract itself it's possible for it to execute a virus.
Renaming the file to EXE would give the user the option of saving it
out and either testing it first or executing it under more controlled
conditions...

> Any suggestions?

Yes, clear now. The answer is simple.
```

When you double-click on an archive which is installed to call STZIPJR
or LHARCENG, the filename of the archive is passed as the parameter.
This is what will make it the only file that gets extracted.

The manner in which ZIPJR acts on the file is defined by the switches
you set when calling ZIPJR.

So, if you install ZIPJR only with the switches -xrg you will get only
the file you double-click extracted into a folder.

Just remove *.ZIP from the argument when you install the application
and all should be well. There's no need to specify *.ZIP in the
argunment because it's only when you double click a ZIP that ZIPJR
will be called anyway IYSWIM.

I don't mean to be rude, but have you actually tried reading Vincent Pomey's STZIP manual? All the options are very clearly explained and you'll discover many tweaks you may like to use. The same applies to the LZHSHELL manual. All options apply equally to the TTp versions of the programs.

For example, the arguments I use for each program when I was on NeST were optimised for speed:

ZIParchive I:\POINT\ZIP.TTP -x -a -edfm
LZHarchive I:\POINT\LHARC.TTP x a /ackmL2wL:\

See what I mean... B^)

From: planetdust@yahoo.com
Message-ID: <e20a265d.0201212010.ee684ed@posting.google.com>
Source record: 38741

Hi all,

For at least a couple years now, I've had an ATARI 520ST computer sitting around with no power supply or any cables whatsoever. I thought the built-in MIDI ports were very cool, and I've always wanted to get it up and running to use as a sequencer (via Cubase). I've never actually used an ST, so maybe I'll end up selling it instead, but I *really* want to get it working so I can judge for myself.

The components I have right now are the 520ST itself, a 3 1/2" floppy drive (I forget the model number), and an SC1224 Color Monitor. None of these items have power supplies or any other cables, so I don't even know if they work at all. The exception is the SC1224 monitor, as the video cable is built-in, and the power cable is either built-in or a standard type. It powers up and I can connect it to the computer, but since I can't power the computer there's no way to know if it really works. Also, I just got an SC1224 version 2, and it does not have a built-in video cable, so I will need one of those. The power cable on the SC1224 v2 is just a standard IEEE power cable, and I have plenty of those around. The original SC1224 matches the 520ST a lot better, but I'm partial to the look of the second version, so I may use that one instead.

Speaking of the SC1224 v2, does anyone know why this monitor was even made and why it looks so different? Is it supposed to match the Falcon? If the Falcon also has built-in MIDI ports, I may decide to use one of those instead if I can find one cheap. Also, wasn't there a *real* "music computer" made by YAMAHA or somebody at around the same time as the ST? That would be ideal, as it really will be a dedicated system. Of course unless someone has an original copy of Cubase (dongle included) for sale at a reasonable price, I may have to use a "warez" version. Anyone who isn't warez-phobic please point me in the right direction.

I also have no manuals at all for this machine, and although I'm sure they won't be absolutely necessary, I'd like to have them. I guess I'll need TOS as well, and I'd really prefer a hard drive instead of having to boot from a floppy all the time, so if anyone has either, let me know. Also, it's starting to seem like there's a lot I'm gonna need to get this up and running, so if anyone's had a lot of experience with Cubase and knows I'd be better off using another platform (Mac or PC), that advice would save me some time and money. I guess I've just heard one too many late-'80s Tangerine Dream albums so now I think I need Cubase on an Atari ST to make good music. ;)

Thanks in advance for any help anyone can provide.

488. highWire version 0.02 Released!

Version 0.02 of the html Rendering Engine HighWire is now available for download.

There have been great improvements in both speed and stability recently. Several little annoying GEM interface problems have been eliminated. Table support has been expanded, however it is not yet finished. We also have a French version of the documentation available with the help of ProToS from the Arcadia Crew. Hopefully this release will silence some of the detractors who have been saying our task is impossible. Our goal is achievable, it will just take time and your support. We can always use more programmers and support on the documentation side of the project always is a critical need. Translation support for more languages would be a great addition to the project as well.

Galen,

quantum fireballs should be quiet, but they are all cheap pieces of trash ;) You should look for a different brand.... Of course I am using a quantum something in my falcon right now. Point is, I've had several of them fail and I keep them well backed up.

Tim,

My roomate's TT does that on an old monitor that used to do it. He has since replaced it with a newer Digiview 17" monitor and sure enough it still did it. I think he went nuts eventually and bought a Nova Mach 64 video card... That seems to have fixed the problem ;)

Hi Galen,

Don't know about the 740, but my 760 works fine with NVDI 5.02 and with
5.03 too (although a bit slower for big pictures). And I don't think
there was anything special to do when I upgraded from NVDI 4.

Sorry I can't be of more help

I hadnt thought of that. Even if I turn the Nemesis off,
I get the same problem. However the Nemesis doesnt seem
to be fully fitted, there are some loose wires and
unfortunately I dont have a manual. It sounds like it
may have been bodged at some point. Is the blitter
something I can replace, or is it soldered to the board?

For Sale

The excellent Expose Falcon video digitiser. Complete
unit with RGB splitter pod, board that fits onto
the Falcon bus, driver software, manual and a copy of Apex
the powerful image/animation package. Probably the
best video digitiser made for the Falcon.

Features include

*Real time video capture in 2, 4, 16, 256 or True Colour (16 bit)

* Capture speed for standard Falcon
128x80 25fps, 256x160 17fps,
512x256 6fps, 512x320 Stop Frame Animation

* Fits inside standard Falcon case with remote RGB splitter

* S-Video input socket + luna & chroma phonos for Camcorder input

* Composite video in (phono) for VCR, etc input

* Direct RGB input can be used

* Colour, contrast and brightness controls on RGB splitter

* Software includes Videobox (images displayed on a cube)

* Falcam accessory, see digitised video in realtime in
a Gem window using the accessory. Plug a TV composite
output into Expose and watch TV on your Falcon!

* Apex - powerful software for image manipulation, animation
etc - compatible with Expose. Disks and manual.

* Manual.

120GBP ono.

For more info, or to make an offer please use
purpletwilight3000@yahoo.co.uk

Cheers, Ian.

It is integrated in the Combel, and you can't replace it.
Maybe it is missing some control signal.

You will have to find someone who has the documentation
of the Nemesis, or find and ask the distributor of this
card.

> when installing 5.5, but beats me if I remember why.

Probably because it's confusing.

I just downloaded DropStuff 5.5 from:

http://my.vector.co.jp/servlet/System.FileDownload/download/ftp/0/36083/
pack/mac/util/arc/dropstuff55.sit.bin

The archive is 1.8MB. Note the Japanese server, which ties in with what
Iggy Drougge said about the importance of LZH in Japan.

The 5.5 "read me" states:

Aladdin DropStuff consists of four components, the program
DropStuff, the Aladdin Compression control panel, the StuffIt
Engine, and the StuffIt Engine PowerPlug. The Aladdin
Compression control panel allows you to select the best
compression method for your needs. The StuffIt Engine and the
StuffIt Engine PowerPlug do the stuffing when you drag items
onto DropStuff. These two components also enhance StuffIt
Expander by giving Expander access to many more translators and
decoders. StuffIt Expander is a separate product designed to
expand common compression and encoding file formats. If you are
not using StuffIt Expander we recommend that you get a copy
today.

So... DropStuff with Expander Enhancer (like in 4.5) is now simply
called Dropstuff. Earlier I said that newer versions of StuffIt Expander
have DropStuff with Expander Enhancer built-in -- I was wrong. I'm
running version 6 of both StuffIt Expander and Dropstuff. (Version 6 is
more integrated since there's no Aladdin Compression control panel,
StuffIt Engine or StuffIt Engine PowerPlug.)

Both 5.5 utilities -- separate downloads unlike 4.5 which had a special
"combo" package -- require at least a 68030 CPU; StuffIt Expander needs
System 7.1.1 or later and DropStuff needs System 7.5.3 or later.
Aladdin's website says that "Users of Mac OS 7.1.1 - 7.5.2 may use
StuffIt Expander 5.5. However, you may encounter some errors or unusual
behavior especially if you are using a 68K Mac."

If you delete all things 4.5, keep StuffIt Expander 5.5, and install
DropStuff 5.5, you should be set for LZH and almost anything else.

<snip>

> Since which MacOS version? I'm using 8.1 but there's no sign of it here.
> Anyway, for Netscape, Internet Config/Internet control panel isn't used,
> so I'll be defining it in Netscape first of all.

Internet Config was adopted by Apple as their Internet control panel
starting with Mac OS 8.5.

Is this an early ST??? If theres no PSU inside it then go buy a later ST four a tenner. That one will have an internal PSU, DD Floppy, and a TV modulator. I'll buy the older one off you for my museum :)

> thought the built-in MIDI ports were very cool, and I've always wanted

> Speaking of the SC1224 v2, does anyone know why this monitor was even
> made and why it looks so different? Is it supposed to match the
> Falcon? If the Falcon also has built-in MIDI ports, I may decide to

Different manufacturers made the 1224, namely Samsung, Goldstar, and JVC. This means that there will be differences between them. Try both out and see which has the best picture. I think the V2 was made to suit the later mega and ste range maybe the falcon too, it has a darker grey bezel around the screen IIRC. It will work with a falcon with the right lead (the falcon has a diferent connector).

> use one of those instead if I can find one cheap. Also, wasn't there

You wont. The average price for a 14mb falc with an internal HD is ~£200 in the UK.

> a *real* "music computer" made by YAMAHA or somebody at around the
> same time as the ST? That would be ideal, as it really will be a

There was another version of the falcon made by a leading music software company that had a different case which was 19" rack mount IIRC. It was basically a falcon motherboard with some hardware hacks for better stability.

> dedicated system. Of course unless someone has an original copy of
> Cubase (dongle included) for sale at a reasonable price, I may have to

> they won't be absolutely necessary, I'd like to have them. I guess

You wont need manuals if youve done any computing at all. If youve used an early gui mac, then you'll fly.

> I'll need TOS as well, and I'd really prefer a hard drive instead of

Its not an amiga - you wont need TOS on disk its built in, unless you have the aforementioned very early ST.

> having to boot from a floppy all the time, so if anyone has either,

You can get a SCSI adapter from the usual vendors or even an IDE if you prefer.

> let me know. Also, it's starting to seem like there's a lot I'm gonna

You all appear to be working in the colour (medium res type) mode.

You need a special lead to put the TT into TT hi res, 1280 X 960 I think.

There is a schematic to build this lead somewhere, if you want mono hi res.

This should work with a modern SVGA monitor but owning 2 x TTM 195 monitors
I haven't tried it.

Cubase and Logic in TT hi res are something to see..... full page of score
or several editors open at once.

Barrie at Keychange.

No, don't do that! The ST is very very useful for music even today!

>

The ST just needs a standard power cable like what you get for PC's,
affectionly known as 'Kettle-lead'

> The exception is the SC1224 monitor,
> as the video cable is built-in, and the power cable is either built-in

Atari used re-banged PC monitors a lot, so I guess one supplier ran out, and
they changed. Or something

> Is it supposed to match the

Yamaha released an MSX clone with a built-in keyboard. But the MSX sucks, so don't go there.

> That would be ideal, as it really will be a
> dedicated system. Of course unless someone has an original copy of

Try to find a copy of Steinberg Pro24 III, it's a lot like cubase, and easy to use. Cubase is a bit hard for me.

>
> I also have no manuals at all for this machine, and although I'm sure

You may be lucky and have TOS built in, but some early models required TOS to be loaded from a disk first. If you need TOS on a disk, which I hope you dont, someone may be able to help you out with a copy :)

> Also, it's starting to seem like there's a lot I'm gonna

It will cost you much more to get a PC or a Mac system up and running, remember a few people are upgrading to bigger and better machines, and Atari ST's are easy to pick up these days for hardly anything. The Falcon though is still an expensive machine, but some people charge quite a lot for one of them. The German ebay is very good for Atari stuff, and most people are very willing to ship to another country.

>
> Thanks in advance for any help anyone can provide.

It might be worth your while speaking to a man called Tim who runs an Atari MIDI website (sorry Tim, I forgot your surname)

All the best, and dont abandone the ST just yet ;)

news:ljkj2a.v41.ln@toy.sector1.net...
> How many version of TOS have been released during ST life? Are they
available somewhere on the net?

The first version of TOS was disk-based, and this was version 1.0. There are some ST's with TOS 1.0 built in, and this stayed like that for a few years. TOS 1.02 was a bugfixed version of the original TOS 1.0, followed by TOS 1.04 (or known as Rainbow TOS because of the rainbow coloured fuji in the About box).

When the STE was launched, it had a special version of TOS called 1.6 which added support for a few STE features. It was buggy as hell though, most famous for the "Medium-rez save bug" meaning the STE was unable to boot into medium resolution. This was fixed with version 1.62.

When the Mega STE was launched, it came with a brand new version of TOS called 2.05, quickly changed to 2.06 because of a few bugs. The TT used TOS 3, not too sure of the exact version number.

The, the falcon machines came with various versions of TOS 4.

There is an enhanced version of TOS 4 used in the Milan clones, and a version called TOS 7 in the Centurbo 2 upgrades for the Falcon.

If you are looking for a version of TOS for running with an emulator, I highly reccomend getting hold of Version 1.0 and 1.4 for total compatibility.

You can download these from http://roms.atari.org or from the Little Green Desktop at http://www.atari.st

Hope this bit of information is of use, and I hope most of it is correct (if it isnt, sorryy)

There are various programs that set the blitter to half the normal speed
which have to be used when speed up over 16MHz. Try that, it's unlikely
you damaged the Blitter all together. Find someone with manual for
Nememsis, enough were sold!

Hi Barrie

I did have an Atari 19" with the 1280x960 res. Cubase is fantastic at this res as you say.But my Monitor broke down, so I want to see if there is anything I can do with a VGA. The one I have is 19" as well.

I still have the cable that went from the TT to the Atari 19". Can this be used. ?? I want to ask first before I try it..don't want to damage the monitor or the TT.

Tim

I'm not sure, didn't the TT in TT high use ECL or whatever it's called to get higher bandwidth and little noise. This is unlike the singals a normal monitor takes AFAIK. They use 5 and -5 volts, or is is more on the current sensing rather than volatge? I have a article about these sorts of monitors.

No they didnt. They were specifically built for Atari by the Mfcr. And they
are not compatible with the PC's of the time which used EGA signals which
were at different levels.

Sync rates are obtained by dividing the system clock frequency. Therefore
the HS and VS are not even -exactly- 35.7kHZ and 71.4Hz (HZ, not kHZ here)
but something like 35.714kHz and 71.29Hz (I think the number of scanlines,
including VS, is 501 not 500) but a monitor has a cerain "locking" sync
frequency range so a Hertz more or less does not matter.

>> No monitors should be 'grainy'. Sharpness depends on focus and

>
>Well, I wasn't impressed with the "high" mono mode on my
>NEC multisync II, and since I never used it for the two colour modes
>anyway I sold it

With colour monitors there are always the problems of the actual pitch
of the shadowmask, the convergence of the beams and the moire effects
caused when displaying fine desktop patterns. Monochrome monitors have
a continuous coating which eliminates this problems, so they are bound to
display a better picture. Problems with coloud monitors can be greatly
reduced by using trinitron-type CRTs (AFAIK that is THE colour tube for any
serious application); with its vertical grille instead of a shadowmask

and with a single splitted beam nstead of three, it (almost?) eliminates the convergence problems existing in "delta" shadowmask tubes. Price of a trinitron monitor is another matter...

There are (or, rather, there -were-) also monochrome multisync monitors for PCs, and they could display all three ST resolutions. I know that some Atarians around here used them several years back, but I don't remember the brand. They were not cheap but picture was quite good.

That was the CX5M and the CX5M-II. Came with a music keyboard and 4
operator FM synthesis very similar to the FB-01 sound module. Yamaha
also made a very expensive PC with multiple MIDI ports built in, I
believe it was called the C1. I never saw one, except in a brochure.
Atari ST and Falcon beat them all when it comes to MIDI anyway.

>

I don't agree with that.
The basic use of Cubase is in fact easier than Pro24. Especially the
arrange window where parts of music are shown as little bars that can be
dragged and dropped from one track to another etcetera. Now imitated by
all sequencers on all platforms. The more advanced functions are another
story, but you can learn those later.

Hi, Bill.

I wouldn't trust the EZ135 too much. I've had cartridges go bad early on,
often in the third partition of four. And now the whole kaboodle has
failed, refusing to read or eject a cartridge: I has to remove the casing
to get it out. Still waiting for my ship to come home so I can send it off
for repair :-(
I just wish I had the means to burn CDRs. Oh well :)

Charles.

Forgive me intervening again, but I've just remembered that a zipped file
can be converted to a self-extracting *.TOS file. The app to do this
(zip2tos.prg) is part of the STZIP archive (stzip26.tos). This would
avoid the bugs in stzip.prg, wouldn't it? Drag and drop...

> Were you able to format them on the TT?

They were originally formatted with Kobold 3 on the TT. On the return
of the disks after loading the files onto a W95 PC the TT's disk drive
(an HD drive only a couple of years old) would chunk away and report
the disks unreadable, so it was impossible even to reformat them...

> I've experienced a high percentage of 3M brand HD disks employed for

The disks I used weren't branded, but I never used to find floppies so
unreliable in the past.

> I'm inclined to think that they were just poor quality disks, except
> that I haven't had a high failure rate on the same brand disks when
> used exclusively on the TT.

True enough. I won't accept that all floppies are so inherently
unreliable.

> How many version of TOS have been released during ST life?

Depending on how you count, as many as 13 versions of TOS were released by Atari. (Some versions were released after Atari, as has been noted by others.)

1.00 disk -- the first TOS
1.00 -- on chip
1.02 -- some bugfixes and greatly improved hard drive performance
1.04 -- a number of minor improvements. The first truly stable TOS with a hard drive.
1.06 -- a special version of 1.04 used for the STe
1.062 - a bugfixed version of 1.06
2.05 -- a considerably improved version, first developed for the Mega STe, but usable on all STs
2.06 -- some bugfixes to 2.05 with 1.44Mb floppy support
3.05 -- a special version of 2.05 used for the TT
3.06 -- a special version of 2.06 used for the TT
4.01 -- the first Falcon TOS. Has a look and feel very much like 3.06.
4.02 -- a bugfixed version of 4.01 that added a very serious partitioning bug
4.04 -- the last Falcon TOS.

Note that the zeros are often omitted, which is why you hear of TOS 1.2 or 1.62 on occasion.

For the typical user, there are really just two TOSs: 1, and 2/3/4, which differ solely with regard to the machine they run on (2, 3, and 4 feel almost identical). Some people may argue that there are three TOSs 1.00/1.02, 1.04, 1.06/1.062, and 2/3/4, but the improvements between 1.02 and 1.04 aren't that earth shattering. It's a lot like arguing that Windows 95 and Windows 98 are different programs.

> Thanks! That's just the kind of news I was looking for!

There was also TOS 2.02 for the Mega STe
TOS 3.01, 3.05 & 3.06 for the TT
TOS 4.01, 4.02 and 4.04 for the Falcon
I guess MultiTOS might count as an official OS too

Of the unofficial TOS's there was:
TOS 1.41 which was a German version of 1.4 IIRC (EOS or KAOS ??)
TOS 4.92 is doing the rounds somewhere

Yup, same here if I set it to pass the filename. The full path option results in the STZIP help screen and an illegal option error message - even with option -x B^(

> Have you actually tried it and gotten it to work?
> Are you using the TOS 2.06 desktop?

I'm using TOS 3.01 I think (forgot to check) but it should be the same.

Everything works perfectly in MagxDesk though. (Not much use for you, I know). Sorry...

Hi,

I've been transferring my collection of cover disks over to my PC for using with my emulators and have discovered that I've lost my copy of the disk which came with issue 11 of ST/Amiga Format (the main demo being Archipelagos for the ST). Does anyone have a copy of this that they could send me? I don't need the original disk, just an image or copies of the files. I'm especially interested in the ST side of the disk, as it's the only one I'm missing from a complete collection of ST/Amiga and ST Format coverdisks.

Any help greatly appreciated, thanks.

Hi folks,
I'm trying to alter some preset values in an old program to those that best suit my needs and Roger Cain suggested using a disk editor to find the address of the data and then use the same disk editor to overwrite the values.

I know nothing about these, so can someone confirm that disk editors can do this and if so anyone do you know where I can download one?, preferable one with good (idiot proof) instructions.

thanks,
Stephen Moss

There are slight problems, however... Two-in-One expects ONE program for each archive type, while InfoZIP/UNZIP are two programs. And Arcview, AFAIK, requires a multitasking OS, which is a slight overkill for e.g. a simple user on a small machine who just wishes to unpack an archive.

Considering 2-in-1, perhaps a small, rather simple, interface program might be made that would launch ZIP or UNZIP as required, and pass (or,perhaps, translate) the required parameters to them, and yet show itself as a single program to 2-in-1 ?

:) Have to add my plug as well...

What would really be cool is an accurate import/export/conversion
utility for current CAD/3D formats used in the world. DynaCadd will
import only simple DXF files, and the converter for Chronos, Rosetta,
is just an exercise in frutility:).
There are a couple of decent rendering applications for the TOS
platform (NEON, POV and Phoenix as well as others). The most
fustrating issue with most (besides running POV on an 030/040 CPU:) is
the lack of a decent file import utility.
Graphics card support for the Cyber series would be very cool as well.

Your certainly welcome to any resources I have, hardware or software.

Best Wishes,
Michael Grove

536. WTB: Drive for STacy

Newsgroup: comp.sys.atari.st
Date: 2002-01-23 18:03:53 UTC
From: progster@iname.com
Message-ID: <2301200213035327 71%progster@iname.com>
Source record: 38689

I'm interested in buying a working hard drive to install in a STacy,
40MB or greater. Anybody got one lying around?

537. Looking for 1040 STFM english language disk

Hi,

I'm looking for a Atari 1040 STFM english language disk. The contents in
zipped format, would be great. Can anyone help me?

Thanks & Regards, Marcus.

This seems to be just one reason more added to the multitude of reasons
never ever to use Win9* ... btw. these days I am having a hard time at work
trying to insert a pair of Win95/98 PCs into an otherwise very-well-behaved
mixed-platform little network consisting of WinNT4 PCs, MSDOS PCs,
WinNT4 Alphaserver, VMS Alphaserver and VMS VAXes... so much frustration
that we are inclined to wipe the '95 off the PCs... And now this business
with writing to floppy bootsectors... in a serious working environment
I do not like some stupid machine writing whatever it likes to floppies
which may contain important data...

Don't forget that this was the first TOS that supported colour icons.

> partitioning bug

Wasn't this a bug in AHDI? Anyway, 4.02 also had an updated AES. Previous
versions had black and white dialogs, 4.02 and upwards has grey.

What size monitor are you using? If you have a 15 inch or less, I would go out and buy a 17 inch one. I think your problem depends mainly on the monitor itself. With my Hades, I have no borders in most of the resolutions I use, but there are a few that have to have them.

Hello,

I have a Hades and a STe that I use for MIDI from time to time. On the
Hades I use Sweet 16 and on the STe I use TigerCub.

For ordering power cabled anf such, try out the sites below:

http://www.vme.net/dvm/aty/

For Midi programs try this site:

http://tamw.atari-users.net/timidi.htm

This is what happens on a system running MagiC. A TOS x.yz is shown as
TOS x.00, at least my TT (resp. Falcon) repports 3.00 (resp.4.00)
although the real TOS version is 3.06 (resp.4.04).

Bye,
/Pascal/

>with the Epson 740 printer. If so, how?

Don't know if this is the cause, but note that the printer drivers
in NVDI are different for 4 and 5. On 5 the driver for (Epson-type)
impact printers in the GEMSYS folder is called PIN.SYS, where in
previous versions it was PINPRN.SYS. The HP-type (laser and inkjet)
drivers have been renamed from PAGEPRN.SYS to PCL.SYS. Furthermore
the standard GDOS printer numbers have been changed: In NVDI 4 I
had 21 for the default HP inkjet and 22 for my NEC pin-printer,
but in NVDI 5 the latter has changed to 25 in the distribution.
You can change it in the ASSIGN.SYS file. Mine in NVDI 5 looks
like this:

```
21 PCL.SYS ; HP DeskJet 520
22 ESCP2.SYS ; Epson Esc/P2
23 CANON.SYS ; Canon
24 MACPRN.SYS ; Mac printer driver
25 PIN.SYS ; NEC P2200
26 ATARILS.SYS ; Atari Laser
31 META.SYS ; Metafile driver
61 MEMORY.SYS ; Memory driver
81 NTOFFICE.SYS; Driver for NT Office Fax
91 IMG.SYS ; Driver for creating IMG files
```

What does yours look like, and which command set does your Epson
have?

Regards, /Peter/

There's a history behind TOS version numbers which people that go back to the early days of the ST might remember. An extract from Mark Baines A-Z book is slightly more complete than yours, but even that couldn't be considered complete. An extract follows:

+++++++++
"The Atari A to Z"
by Mark S Baines
Copyright (c) 1998 Mark S Baines
All Rights Reserved

TOS version numbers
The TOS version number is coded into the ROM at the address pointed to by the _sysbase system variable plus two longs (sixteen bytes). For TOS 1.0 the value in the ROM at this point is $0100 which is commonly interpreted as 01.00 or 1.00. Similarly, TOS 1.2 has the value $0102 and was, for many years, interpreted as v1.2. However, when TOS 2 and 3 came out the numbering system was changed to include the zero before the minor part of the version number, hence TOS 2.05 and TOS 3.06. Atari also decided to change the numbering system of earlier TOS versions retrospectively leading to much confusion which persists today. TOS 1.2, 1.4 and 1.6 therefore became TOS 1.02, 1.04 and 1.06. However, TOS 1.62 remains as such (and not 1.062!) as its ROM value is $0162. However, this version number implies a far greater upgrade from TOS 1.06 than actually took place.
..

Table T1: The TOS Version Numbers

os_version Old New Name
_sysbase+2 Number Number
$0100 1.0 1.00 ROM TOS or Old TOS
$0102 1.2 1.02 BLiTTER TOS or Mega TOS
$0104 1.4 1.04 Rainbow TOS
$0106 1.6 1.06 STE TOS
$0162 1.62 1.62 STE TOS
$0201 2.01 Mega STE TOS
$0205 2.05 Mega STE TOS
$0206 2.06 Mega STE TOS

$0301 3.01 TT TOS
$0305 3.05 TT TOS
$0306 3.06 TT TOS
$0400 4.00 Falcon TOS
$0401 4.01 Falcon TOS
$0402 4.02 Falcon TOS
$0404 4.04 Falcon TOS
+++++++++

TOS versions that I'd contend were missing from this list:

The first disk-based TOS may even have had a number of 0.9

The earliest ST's - that is the 520ST (no floppy or modulator), STF
and STM had TOS 1.0, but the STFM in the UK had a TOS version known as
1.09. Mark's take on this is as follows:

+++++++++
There has been a version of TOS in the UK under the version number of
1.09 which has caused much confusion over the years. TOS 1.09 appeared
in late 1987 as an Atari UK version of TOS 1.2 in answer to the Mega
ST and the provision of the BLiTTER. Atari UK named it TOS 1.09 but
Atari US would not make this number official. TOS 1.09 was replaced
soon after with the official TOS 1.2.
+++++++++

Where this number came from is in doubt based on the info Mark
gives above, but it was certainly different.
Mark also later refers to TOS 2.02 rather than 2.01 shipping in the
first Mega STe's.

Other notes:
TOS 1.02 was standard in the Mega ST but only available as an upgrade
for the ST(F)(M) series.
TOS 1.04 was never installed as standard in any machine, only as an
upgrade.

Can anyone else (with a better memory than me or who has copies of the
original ST Club Newsletters and catalogues where some of the earliest
TOS's were available on licensed disk) remember more?

I have a question for my Falcon. On my hardrive I have a couple fo folders that don't open, don't make sense, and I'm not sure how much space they are taking up. They are all named UL with a 2 dots above the U. Everytime I try to delete them they say that I can't delete them. How do I get rid of these?

Thanks,
Michael

> modulator. I'll buy the older one off you for my museum :)

At the risk of sounding like an ungrateful asshole, I really need to
add "NO UK REPLIES" to the subject lines of my posts. A "tenner"
would be nice to have since we don't see many British notes here in
the US, and I'm happy the shops are brimming with STs in the UK, but
that does me no good here. I actually have TWO 520STs, and they're
identical.

> SF354 or 314???

Something like that -- probably the SF354.

> Different manufacturers made the 1224, namely Samsung, Goldstar, and JVC.
> This means that there will be differences between them. Try both out and see

You recall correctly -- the bezel is a darker grey... and if I could
try them out I would, that's the whole point of the post!

> You wont. The average price for a 14mb falc with an internal HD is ~ï¿½200 in

> basically a falcon motherboard with some hardware hacks for better
> stability.

Uh, no. CASIO, YAMAHA, something. The MX7, maybe?

> You wont need manuals if youve done any computing at all. If youve used an
> early gui mac, then you'll fly.

Good to know. I have about a dozen old Macs around. No mouse for the
ST, though.

> Its not an amiga - you wont need TOS on disk its built in, unless you have
> the aforementioned very early ST.

I don't need a Kickstart disk with my A1200 either, but I'd need
Workbench on a boot floppy if I didn't have a hard drive. THAT's what
I'm talking about.

> You can get a SCSI adapter from the usual vendors or even an IDE if you
> prefer.

Which part of "newbie" are you having trouble with -- "new" or "bie"?
The usual vendors indeed...

> You can write your music on the atari. If your worried about money, how much
> is a PC gonna set you back?

Er, nothing. I also have Macs that can do the job. My dilemma is
that a PC will be used to record the audio on a hard disk for
editing/burning to CD. So how does the very same PC sequence and
record at the same time?

Okay, OKAY! I'll go with the ST... remember that's what I WANT to do?
That is if anyone can tell me where to get cables that doesn't
require hopping across the pond.

> The ST just needs a standard power cable like what you get for PC's,
> affectionly known as 'Kettle-lead'

Righto. I'll just pop down to Harrod's and drop a quid on a good old
"kettle lead". Better still, I'll nick the one off a kettle I've got
tucked away in a cupboard somewhere around the flat. Then I'll hop in
the Morris for a jaunt down the M1. PLEASE, PEOPLE... I'M IN
AMERICA!!!!!

> Atari used re-banged PC monitors a lot, so I guess one supplier ran out, and
> they changed. Or something

I'm guessing they just switched suppliers and/or went with a new
design.

> Yamaha released an MSX clone with a built-in keyboard. But the MSX sucks, so
> don't go there.

No problem. Of course a lot of games were released for the MSX, but I
guess an emulator will do for those.

> Try to find a copy of Steinberg Pro24 III, it's a lot like cubase, and easy

Well, I'll use whatever's more intuitive, but I just love how I say "I
need software" and the answer is "get some software". I say "I have
two monitors that I can't use because I can't hook up the computer"
and the reply is "try them both out and see how the picture looks".
Useless, useless, useless.

Well, I hope that's not my only option. Lucky I have a couple
monitors, which would be too expensive to ship. Do either Cubase or
Steinberg require a monochrome monitor? I thought having a color
monitor was a GOOD thing, and then I find out that mono is better.
Weird.

Hello,

I live in Ottawa, and am broke as usual. Otherwise, I'd buy
the magazines at least, probably other things, too. I'd even be will-
ing to make a promise to pay an extra fee just to make it worth your
inconvenience to keep them for a while, til I could pay you.

I really just posting to let you know how upset it makes me to
see irreplacable computer SW & HW be simply destroyed. 2 months ago, I
bought some great Amiga SW & books, for $20.00, from a guy who was going
to just throw them out. He & I both profited from this transaction.

Have you contacted the Toronto Atari Federation, to place a
classified ad, or tried an ad in the local paper?

I have space problems, too, but destroying computer gear isn't
a solution I've considered.

Prehaps I sound full of myself. I don't mean to. I just love
classic computers.

Regards,

Gary

P.S. I have a Falcon, ST, & 800 XL, as well as other classics. I love
them all.

That is wrong. I have a 1040STFM with German TOS 1.04 (as you call
it, i prefer to call it 1.4) and the TOS was never upgraded from
anything else. It came with that TOS out of the factory.

The ST Format coverdisk 11 is at http://dewey.ecs.soton.ac.uk/stformat/
But this seems to be something different since in the list of contents
Archipelagos is not mentioned.
But maybe you could help the maintainer of the page since he is
missing four or five ST Format coverdisks :)

Hey guys,

I am not sure if I want to sell this or not, but perhaps someone can convince me who wants it enough. Make me an offer and I'll see how I feel.

Seeing as how I have a Falcon now and my CT60 is coming, I have a Mega STe that I am not sure what to do with. It would come with 4 megs of RAM, PC power supply and adapter, ICD Link/2 Special edition (clear case), 720K floppy, NO KEYBOARD!!! (sorry :( ), Seagate Hawk 1 gig SCSI/2 hard drive. 2X or so caddy loading cdrom drive.

This machine has the VGA modification done to it to enable use of a VGA monitor. It is hardwired for ST-High and would have to be rewired to do ST-low and medium or a switch would have to be wired in. The serial ports of this machine (with the exception of modem1) never seemed to work right. I could never do 38.4 or 115.2 without extreme errors. It is mounted in an extremely large and heavy sun photo processor tower case. The mounting job is bad, but upon a serious offer I would either ship without the case or remount onto a specially made plastic platform and do the job right. For the curious, a picture can be found at:
http://pikachu.atari-source.com/pictures/megastetower.jpg

Unfortunately the QWERTYX pictured does not come with the machine as I do not own it. This Mega STe also has no 6881.

I am being brutally honest with this sale for many reasons. Because I really might not like to let go of it, because I'd like it to go to a good technically minded owner, because I don't want any buyer remorse, bad feelings or negative karma against me. Lastly, this board was purchased under Toad Computer's going out of business sale. It is equipped with TOS 2.05 and 720K fdd only. The board was sealed and in NEW condition in it's purchase in I believe 1998. I forget when I bought it, but this machine is not flaky in ANY WAY and might be the best condition you can find such a beast in. Unfortunately, because I bought the board only, there's no mega ste case or PSU available either.

Correct. Later STFM's that were built after the STE (which first came with 1.6) came from the factory with 1.4. Btw, this was in the UK.

Not correct. My first and second ST (520STM and 1040STFM) were both
fitted with 1.02 from factory. I believe there were sold a lot more
ST's with 1.02 that 1.0. Atleast here in Europe, where 1.0 completely
disappeared from the market in 1988 or 89. I've only seen STF's and
STM's with 1.00, all STFM's I've seen has had 1.02 or 1.04.

> TOS 1.04 was never installed as standard in any machine, only as an
> upgrade.

That's not correct either. A lot of ST's - in particular the low-price
520 that sold quite well in UK the last two years of the ST - was
fitted with 1.04 as standard.

It must be an early one. The 520STFM came early in 1989, atleast here in
Norway (bought one of the last STM's in 88, with 1.02).

Some more unusual bits ane pieces of hardware:

1) PC-Speed (Compo Software)

Hardware DOS emulator for Atari ST / Mega ST. Fits
onto existing 68000 cpu. Unit includes PCB with
NEC V30 CPU, driver disk and 59 page manual. You
will need 1 or 2 68 pin DIL sockets to aid in mounting.

30 GBP

2) Overscan (Overscan GBR)

Overscan increasses the resolution of our Atari ST/Mega ST
video output. This unit is compatible with 68000,68010,
68020 and 68030 CPUs so may suit accelerated systems. Max
resolution depends on monitor, etc. Manual shows resolutions
of up to 704 x 480 on newer Atari SM124 monitors, and 752x280
on Atari SC1224 monitors. Compatible with NVDI. Units includes
PCB, 66 page manual and driver disk in original plastic wallet.

40GBP

3) Forget-Me-Clock II (Frontier Software)

Clock cartridge plugs into the ROM port of an Atari ST/STe. Full
pass through. Sets clock automatically on power up. Unit includes
cartridge, 8 page manual, driver disk in original box.

40GBP

Note: the FMC-II setting software is NOT Y2K compatible. There is a patch available somewhere (don't remember where) that works around this problem.

But the cartridge itself is Y2K compatible. Which makes me wonder. Is it so difficult to make new software for this cartridge. If someone knows how the ST reads and writes time/date data from/to this clock cartridge , that shouldn't be too difficult ?

Martin Tarenskeen

569. TOS emulation on Mac and PC

Newsgroup: comp.sys.atari.st
Date: 2002-01-24 21:34:23 UTC

Message-ID: <fc53daf3.0201241334.4e682242@posting.google.com>
Source record: 38623

It's been almost a year since I last fired up my Falcon, still in pieces after testing a 68060 on my Afterburner. Final answer to that solution was to let Rodolphe finish up his hardware:) Can't wait until it's transplanted into one of my Falcons. I just recently retired my Quadra 840 which had happily running MagiC Mac seemingly forever. In it's place is a new wizz-bang PC. I wanted a Mac, but outfitted the same, one would have cost quite a bit more than the coffee cup warmer I purchased in the end. The Quadra may still be used as a server on my local network, can't just toss it in the can no matter what it's worth.

So, after about three days working with Windows XP at home i've come to realize that however fast and versital the new PC is, it's not an Atari or Mac:) Actually something I already knew:)

Has anyone extensive experience with MagiC PC, how it performs along side with MagiC Mac. Is the NVDI PC version the same as NVDI 5.02 for TOS? I've enough experience with GEM applications and non-GEM applications under NOVA VDI and such, don't need to go into that here. I'm not interested in gaming or a VDI that supports less than 15/16bit color.

What about Derriks SoftMac XP package and the current version of Gemulator.
From what I can tell about Gemulator, it still only supports 16 color, hardly worthy of trying, but if MagiC Mac can run under his SoftMac emualtor......

I would rather spend the 200 bucks or so getting one of those packages than even begin to shop for compatible Windows softs. I have several Mac animation and rendering applications (FPU required)that are more than acceptable for what I need, and provide a decent graphics bridge over to TOS. Of course on the TOS side, I want to still be able to use Dyna Cadd, Phoenix, Chronos, Calamus, all which would look very nice on a 19" monitor. Apex, Rainbow and other Falcon only applications will work better when the CT060.

Pointers to new and current FAQs would be apreciated, but would rather converse with someone actually utilizing the packages in a simular enviroment as myself. The PC specs (not for spamming or bragging are in no peticular order)
Dell 1.8Ghz P4, 512mb RDRAM, 10/100 ethernet through a Linksys cable modem router, C80 Epson with HawkingTech print server attached. I want to network the Falcon into this, but the cartridge port ethernet connectors are still not available, so likely will go through the serial port to the Mac if it becomes a server, or to one of the other

PCs on the network if a parallel network connection is faster.

No, I still have no spelling checker,
Thanks,
Mike

572. English desktop over German GEM

Hi group,

I have a 1040 ST with German desktop, but would like to change it into
an English version. Do I need an English TOS version for that, or is it
also possible to change it by software?

Thanks,

Marcus

Marcus,

You can load a TOS image up with software, by loading a new TOS image you would be effectively changing the language to whatever language that TOS is. There's something out there called KAOSTOS which I believe was a slightly modified version of rainbow TOS (1.4). There's the last route of booting up something like MagiC, MiNT and N.Aes or XaAES or something else. Any one of these solutions come at a price of memory usage. If you want the system to work exactly the same as it does now, but in English, you will need to get English ROMs.

Ok fucko, somehow I live in america too and I don't have problems with these things, that is if you arent' afraid to mail order something. Your 520 ST will MOST LIKELY have built in TOS... GUI and all. You don't need to "warez" the OS to get it running. The power supply comes in two flavors. If you have a round power connector on the back, you need the "brick" style external power supply. If you have a standard IEEE plug, well... I think you know. The Atari ST isn't a current production computer, you can't just waltz into rat shack and buy the stuff you need for it. And if you are missing so many cables, your absolute best bet would be to go on ebay and buy another ST for $5. I believe there's a 1040 on there now for $7 last I checked. You'll need to get a scsi interface from http://www.atari-workshop.co.uk. This is called the ICD Link or Link 97 or whatnot. You can obtain an internal IDE interface by contacting Mario Becroft at http://gem.win.co.nz/mario/hardware/ . Best Electronics has a lot of what you need but at a high cost usually as Atari stuff brings their paychecks home. http://www.best-electronics-ca.com/

You will not usually find much atari parts for sale by single though. Most of the time it's a package deal except for expansions. For example, getting the connecting cable and power supply for the floppy drive is a worthless mission. If you buy the 1040 on ebay, a floppy drive will already be built in. Building an atari from scratch requires a lot of patience. You will have to wait for the parts to be available and perform exhaustive web and auction searches to find them. You don't sound like a fellow with much patience.

Now. I believe I've helped you to the maximum of my desire. Frankly, I think you best watch what you say about 'warezing' out software. A very large percentage of the readers and posters to this list are active atari developers. Some of them do their work for free, some for GNU GPL, and some are commercial authors. Cubase and steinberg products are commercial for a reason. Because they're extremely high quality. If you want cubase

and you don't want to pay for it, I suggest you get out your good old C compiler and start coding a copy for yourself. When you realize how much work it would be, maybe you would show some sort of appreciation for the cost of a copy.

Atari's have limited video memory. The more colors you display the more resolution it costs you. When working with a huge midi score, you might want to be able to fit more on your screen and sacrifice a few worthless colors. This is where the benefits of a monochrome monitor come in.

You've been directed to Tim's Atari world in several posts now. http://tamw.atari-users.net. There's several MIDI programs varying in quality. A lot of them used to be commercial but are now graciously released for free. If you want to do anything, start there.

Your best and/or cheapest route for building an atari is to just buy another one. Unless you're so cheap you won't buy a computer for $10 or $20, in which case I can't nor will I help you.

Next time you ask for help maybe you should think and use a little patience. There's very many varying atari models, and people are giving you the best advice they can.

Don't be a d*ck, and I'll be nice as well.

Byte 2 to 7 of the boot sector on an Atari or DOS disk is either
'Loader', which presumably is used when a boot program is in bytes
30 to 509, or third party formatter name. So writing 8 bytes there
will do no harm. Bytes 8 to 10 contain the serial number, which
the Atari does not use#, so this too could be overwritten.

except to check for disk changes, comparing the serial numbers,
but again this can be anything.

But I would have thought that if the disk is write-protected, the PC
can't write anything to it. But then again, this *is* M$, so who
knows.... :-(

The NEC Multisync monitors are good. I am just using a cheap generic 14"
GVC monitor. It's as generic as they get. Any newish monitor will do all
of the resolutions without trouble (I think). my 20" monitor and my 17"
monitor have never had troubles with any ST resolutions or refresh rates.
My 17" was a Gateway EV700 17" monitor and my 20" is a SuperMatch. The
supermatch I think was a very expensive once upon a time professional model.

No, unfortunately I was too lazy to make the switch box so it's stuck in
the most useful mode of ST-High ;)

I think you'll find it's not as bad as it sounds. My 14" monitor recently started doing weird stuff in ST-High mode, I think because I didn't include the resistor in my adapter. It's certainly not a frequency problem though as the picture is perfectly stable until the monitor warms up.

> as without it I don't have any way to even get online and ask for help.
>

You have to understand, the refresh rates that they are talking about are extremely high, whereas the ones on the ST are not. What can damage a monitor is something like 1280x1024 res at 100Hz refresh rate. The ST would probably be 640x200 or 640x400 at 50 or 60 Hz. In theory you could still fry your monitor but I've done a LOT OF REALLY MEAN things to monitors and I've never blown one up yet.

MEAN things, like trying to get a 14" to do 2000x2000 resolution :)

I purposely tried to blow it up and couldn't, along with several other monitors. I guess I am just evil like that :)

If the ST resolutions hurt your monitor, let me know, and I'll ship you a brand new 15" that will work fine for free.

The only alternative seems to be using a shell, then, but that will require setting up. For a one-pass solution TWOINONE's manager would be a solution, but it requires quite a bit of setting up, which I know you want to avoid. STZIp itself might have to be the simplest two-pass solution unfortunately... unless someone else has sussed it out?

Blimey - those comments seemed to say more about my poor memory than
they ever did about the ST!

Still (at the risk of showing myself up even more) I've got some
distant memory of this v1.09 getting described as 1.02. I'm wondering
whether 1.09 was a description of 1.02 when it was fitted in the ST
rather than Mega ST.

Ok, I may well be making this all up... %^?

>> TOS 1.04 was never installed as standard in any machine, only as an

Point taken again. I completely forgot that period of time. I may've
been right about the original period of STFM manufacture (pre STe) but
I definitely forgot the mop-up operation...

It could be that he's omitted the copyright software that was only
licensed for released on the coverdisk.

TBH you aren't missing much. Archipelagos was one of the few pieces of
game software I ever bought and it never worked properly on my machine
- it locked up after just a few levels IIRC.

Checking all the TTP's on my hard drive, the only ones of any use are
those that accompany STGuide - HCP, HYPFIND etc. Everything else is
related to archivers (MUNPACK) or print utilities which are a bit crap.

The 1.x versions of TOS are language specific. I'm not sure about 2.x
and 3.x. 4.x can be changed via software.

On the other hand, you can ADD desktops, such as Thing or NeoDesk in
many languages.

The Epson 740 is the last (as far as I know) of the Esc/P2 printers,
which is why I bought it. I didn't play around with ASSIGN.SYS, but I
will when I try NVDI 5 again. I do recall that I only had #21
available, and had to change printers from the printers.cpx. Perhaps
they weren't changing -- that would explain why the HP worked and the
Epson didn't.

Thanks for responding -- good food for thought there.

Apparently not. You are looking for a 1/3 height 3.5 inch SCSI-1
drive. Best of luck to you.

This is the disk that originally shipped with the ST. Contains the crappy
ST Basic, the Control Panel and the VT52 emulator.
The one who asked for it, http://stappz.atari.org/ has one IIRC.

Ther is a programm called "guck" which is very fast.
But it con only be used on SingleTOS machines. It will afaik not run
under MiNT/NAES/... or MagiC.

I think i have a version on my FTP server:
ftp://ftp.uni-giessen.de/pub/atari/viewer/

But perhaps there is a newer one around...

scrisse al povero All :
r> Has anyone extensive experience with MagiC PC, how it performs along
r> side with MagiC Mac.

MagiCMac on an old Quadra800 is as fast as MagiCPC on a new PentiumIII
400-800, the main differences are:

- MagiCMac can crash all the OS as has complete control over the Mac, where
MagiPC emulates 68K instructions, so normally in case of crash you just need
to restart MagiCPC, faster then a complete reboot
- MagiCMac may be more compatible due to no need of CPU emulation
- MagiCMac run faster (on Macs newer then mine) as no CPU emulation
- The real boost is a FAST hard drive, that unfortunately I can't have on my
Quadra800

Both PC and Mac let you use only one serial port, you can access networked
drives (use DAVE on the Mac or PCMacLAN on PC), use higher screen resolutions.

I hope this advert is OK on this ng - I'm not a regular. I've a couple of boxes of Atari software to find new homes for. I run a computer recycling project at York University, and any money it makes goes to charity.

First, the stuff I'd like a bit of money for (make me a low offer):
Steinberg 24 v.3 with dongle, possibly not all disks, but boxed and manual
Cubase dongles, and a Cubeat dongle (no disks or manuals).
A switchable cartridge port expander.

Secondly, the stuff that's free (bar P&P):

Atari ST manuals, Cubase Score manuals, Steinberg 24 v.3 box and manual, First Word Plus and DTP (no manuals/boxes), various coverdisks and backup for DTP and paint programs. Casio CZ patch program, and ST Basic manual. Various Family Curriulum boxed packages with manuals and disks: GCSE revision, Creative Computing, Play and Learn, Junior School module.

If anything is of interest, please email me. I don't usually subscribe to this newsgroup, but I'll keep an eye on this thread in case there are any responses.

Alastair

Thx's Lonny. The firewall here won't allow Geocities sites, can't
understand why:) I'll look at home.
I did find another option, a package called Basilisk, that includes
the JIT compiler as a configuration option. Benchmarks show this
package blowing all the others off into never never land. The only
down side, even with this faster emulator is FPU suppose to be slow,
but I don't have any data to compair with. Slow to what, an 840 040
Mac?

:> I have a 1040 ST with German desktop, but would like to change it into
:> an English version. Do I need an English TOS version for that, or is it
:> also possible to change it by software?

Greetings,

One approach that I take with my German ST-Book, is to use a program that simply re-maps the keyboard into the english configuration, and use apps that are in english. This still leaves the desktop menus in German.

The other approach is to load an executable version of TOS from the Auto folder, although this has the disadvantage of not being compatible with programs such as Warp9 or NVDI - at least with the version I am using.

Any better solution would be welcome, or an English ST-Book rom would do nicely ;)

Any reason that you don't just pop in a set of English roms for the ST? These are fairly easy to come by. I may even have a set in deep storage.

Cheers!

You could use an alternative desktop like THiNG, which is also available
in English. But that would be a waste of memory if you only have 1 or 2 MB
Ram. And you would still get German messages from TOS frequently.

In my STf I have TOS 1.04 roms in Dutch. Must be quite rare :)

Think again...

>There is a schematic to build this lead somewhere, if you want mono hi res.
>
>This should work with a modern SVGA monitor but owning 2 x TTM 195 monitors
>I haven't tried it.

You need an ECL type monitor, Philips and EIZO sold suitable models. The cable
you're referring to probably is ment for one of these.

>Cubase and Logic in TT hi res are something to see..... full page of score
>or several editors open at once.

The best way nowadays to see 1280 X 960 resolution is to put a graphic card in

the TT and use a 19" SVGA monitor, a NOVA Mach64 with 4Mb will take you al the

way up to 1600*1200, the TT Hi resolution is displayed roughly 8 times faster
and if you are impressed by Cubase in Hi res, just try to imagine how modern
Atari apps look at 1600*1200 in glorious 16 or 24 bit :-)

Cheers from Belgium
Dennis

Hi Grzegorz,

>Can I use MagicVME graphic card (with *TSENG TC6100* chip)
>on my TT with NVDI 5 and MagiC 6.2?

NO!! this chip is not supported by any of our graphic card drivers.

>Will I have to use vmg-4000.prg (from NVDI package) to make NVDI work
>with that card?

NVDI will not work with that type of card, forget all about it....

>I am asking because I don't know if I should buy that card or not. I
>cannot resign from using NVDI, because I need vector fonts and printer
>drivers.

Since you obviously have the the ISA to VME interface, go hunting for an ATI
card with a Mach32 of 64 graphic processor, cards like these were available
with ISA interface in 1, 2 and 4Mb configurations. The Nova graphic card
driver is top notch for these cards and NVDI supports them fully.

Cheers from Belgium

>I'm trying to figure out how to print with 1STGUIDE.PRG, and also what

Once you're viewing a file with 1stguide, press [CTRL] A to get to the setup window. The first two buttons switch output from screen to device. Device paremeter at the bottomish right allows you to set which device that is, set it to the same number as your printer is in assign.sys. You can also set how the page is scaled and where the image is positioned on the page.

The next time you view a file it will be sent to the printer and not the screen.

Note that it will NOT print text files, which is its only failing.

The best alternative desktop for plain TOS is TeraDesk. It can be found
at http://www.umich.edu/~archive/atari/Utilities/Desktop in two versions,
one works fine even with TOS 1.0, the other needs 1.04 or more but also
works with Geneva (a kind of multitasking AES for TOS).

Thing or Jinnee take much more RAM, and in fact it is impossible to
use eg. Thing on 1040ST with 1MB RAM due to lack of free memory.

I don't have such an interface. This card is a VME card, it comes
with its own software drivers, I hoped it would work with NVDI, but...

Where could I get ISA to VME interface?

Gamer,

Put the Mouse on the program and click the right button and hold and a configure menu comes up and the next level down is the print menu but it is all in german and I can't make it work??

A picture I was viewing in 1STGUIDE looked good, so I loaded it into IMAGECOPY 4 to print, but IMAGECOPY showed it real dark, and not being good with IMAGECOPY I couldn't get it to look normal. So I tried 1STGUIDE. Not sure what version I have, I downloaded it in 97 ??

Thanks, Donner....

I think you will find that 1.09 is a false interpretation given by
some programs evaluating the address pointed to by _sysbase+16.
Possibly because it does not use the Intel byte order?

>confused now.

No, you are quite right Hallvard - that is what I meant by my
comment marked #:
"# except to check for disk changes, comparing the serial numbers,
but again this can be anything."

But as long as whatever is in that position is not the same on two
disks running, there should be no problems. In any case most such
problems can be overcome with the tiny FMC.PRG in AUTO which
forces a media change. If you want to be 100% certain that the ST
will not use the stored old directory information for writing to
the newly inserted disk, press Esc if on the desktop after the
disk change, or from within a program just use Save as... and save
to B: -- if you don't have an external B: drive connected, you
will be prompted to insert disk B in drive A, after which you just
press Return. This will reread the directory of the disk you are
writing to for sure!

Regards, /Peter/

Hmmm...interesting link. I don't know what it's for. I was responding to the ad. I have no affiliation with B&C Computervision (www.myatari.com). I know them to be reputable as I've done business with them over the years (I used to live in the Bay Area).

I post the link as a response to BS Computers ads because of this page:
http://home.pacifier.com/~atari/auctions.htm
I have auctioned Atari material and I test mine what I sell quite rigoursly.
I think their characterization of auctions is self-serving and inaccurate.
I like to make sure people know they have an alternate choice in online Atari stores.

I don't have any problem with the occasional ad posted to the Atari newsgroups. It's a small community and I don't think it hurts the group to have ads every so often.

627. Highwire/Menuwire 0.2

Newsgroup: comp.sys.atari.st
Date: 2002-01-26 23:06:05 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <a2vcot$q67$1@thorium.cix.co.uk>
Source record: 38578

Hi!

Anyone know how to get in touch by Email with the Highwire
authors? I have just downloaded V0.2 of Menuwire and find it has
bugs I want to report. I can't get the 'Forum' link to work. If anyone
else can, can they please repost this or pass the message on somehow?
Thanks!

For general interest, it's these: When loading in col_test.htm,
which uses javascript which is linked to two pages meant to
display in the centre and both side panels; the central one seems to
wrap OK, but the text does not reformat in the outer panels so that
only part of it is visible. Scrolling to read a long text is far
too laborious. If that panel text excerpt.htm is loaded as a
separate page then it displays fine. Interestingly enough, although
this page uses javascipt it seems to work OK in CAB. It takes *much*
longer to load there, but the side panels are formatted correctly.

In all resolutions I have tried (mono, 256 greyscale, 16 & 256 colour)
there is almost nothing to distinguish the links - they work if you
know where they are! :-) But otherwise you can't find them if they are
in the text! :-(If on a white background then those in the text are
a dark blue that is hard to differentiate from black. And once you
have moved the cursor over it the link turns black and stays that way
when you move the mouse away without clicking! This is in Highwire's
own htms; others seem OK, so perhaps this is just an unfortunate
choice of colour in the Highwire htms. In 16-colour mode, the links on
the main page don't appear at all! But even so: Please make the links
underlined!!! (In CAB these links look fine, so it's Highwire's fault!)

And the page name at the top stays the same (\html\highwire.htm) no
matter what you load!

Also, it seems a pity that one can't blow up the contents of a
frame to full screen size.

Some pages (e.g. many dowloaded OK in CAB from the the aixit website)
do not format properly - the left hand edge is cut off.

But it's early days yet, and the files I have tested display *far*
faster than in CAB.

Regards, /Peter/

520 STFM Came out in the UK early in '87 for ?399 I think. Tos 1.02 came out later that year. I remember because people were writing in to 'popular computing weekly', moaning about games not liking the new TOS.

Anyway, does anyone have a disk based 1.0?? I know very early versions displayed mushroom clouds instead of bombs for a crash.

Hi Hallvard,

>> Ther is a programm called "guck" which is very fast.
>> But it con only be used on SingleTOS machines. It will afaik not run
>> under MiNT/NAES/... or MagiC.
>
>Actually I just had a look at this viewer as I dug through old software
>I had compiled on a CD-ROM of mine. Looks like the TOS "show"
>replacement so far. I think I'll include it in the TOS 2.06
>documentation project.

What about assigning the files to ST-GUIDE if this is installed? Another solution could be the QED text editor, which is available in different languages. Both of these apps don't require a lot of memory and offer features like printing, search, cut to the clipboard etc...

Cheers from Belgium
Dennis

630. Re: Question regarding NVDI 5 and Epson 740

Newsgroup: comp.sys.atari.st
Date: 2002-01-27 02:20:12 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1012138630-54800AEicMi@gmx.net>
Source record: 38591

From: ekaljuma@mtsac.edu (Galen)
Date: 24 Jan 2002 18:34:02 -0800

Hi Galen,

>The Epson 740 is the last (as far as I know) of the Esc/P2 printers,
>which is why I bought it.

It isn't, all the Epson Color printers up to the 980 have an Esc/P2 mode,
even the latest models C60, C70 and C80 can still be used with NVDI. The
maximum resolution possible under NVDI 5.03 is 1440*720 in true colour
mode.

>didn't play around with ASSIGN.SYS, but I will when I try NVDI 5 again. I
>do recall that I only had #21 available, and had to change printers from
>the printers.cpx. Perhaps they weren't changing -- that would explain why
>the HP worked and the Epson didn't.

This is a common made mistake. There's no upgrade available from NVDI 4.0
to NVDI 5.0, one should delete everything which is related to NVDI 4.0 and
then install NVDI 5.0 from scratch. In the PRINTERS.CPX one can choose an
installed printer, but to actually install the printer you need to run
INSTPRNT.APP first, that file is located in the NVDI utilities folder.
Do *NOT* play around with assign.sys files created by older versions of
NVDI, but get rid of them.

Cheers from Belgium

Hi Mark

>There's something out there called KAOSTOS which I believe was a
>slightly modified version of rainbow TOS (1.4).

Slightly modified? ROTFL !!!

KAOS is an alternative OS which is compatible with TOS 1.4, Andreas Kromke
the programmer rewrote and optimised all the buggy and slow parts of TOS,
the result was an extremely fast OS which could run most of the Atari apps,
although offering more features then TOS, it left 21Kb more memory free for
the user, on average KAOS is roughly 12% faster then TOS 1.4, which was a
hell of a lot in those days...
The last version was KAOS 1.4.2, it was renamed to MagiX 1.0 in early 1992,
MagiX was later renamed as MagiC.... except for the multitasking routines
KAOS is pretty much the same thing as MagiX. KAOS didn't have a build in
desktop, it came standard with KAOSDESK 1.0 which all MAGICDESK users will
recognise instantly.
KAOS was very popular in Germany, German Atari users taking their computer
seriously in those days replaced TOS and never looked back... and the real
clever users upgraded to MagiC later on and until today still never had to
look back :-)

Cheers from Belgium

Hi Hallvard,

>It worked, it worked!!!!!
>I took you up on the suggestion of using 2-in-1 for ZIP files and it did
>what I want it to. I'll continue testing it for different situations,
>hoping that it won't disappoint me again like those other programs did
>which initially seemed to do the job as well.

Ofcourse it works, that's something a lot of us could have told you from
day one, but you kept insisting on using the crappy TTP and command line
options. TBH I was waiting for some of the "command line lovers" to come
and help you out, since time and time again I've got to hear and read here
how easy it is using that crap....
Considering the information is ment for the 2.06 FAQ which is geared
towards newbies on this platform I don't think it's even a good idea to
mention stuff like TTP and command lines at all. There's no need tho use
these ancient monsters, and like you found out yourself, they severely
limit what you can do.

Just in case a "command line lover" wakes up after reading this, before
flaming me tell us how to unpack a couple of files from within an archive.

TOS 2.06 will need a very large argument line..... :-)

Cheers from Belgium

633. Re: ST --> Mac monitor?

Newsgroup: comp.sys.atari.st
Date: 2002-01-27 03:52:58 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1012138632-55423AEicMi@gmx.net>
Source record: 38592

From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Date: Thu, 24 Jan 2002 19:56:07 -0500

Hi Mark,

>Any newish monitor will do all of the resolutions without trouble (I
>think). my 20" monitor and my 17" monitor have never had troubles with
>any ST resolutions or refresh rates.
>My 17" was a Gateway EV700 17" monitor and my 20" is a SuperMatch.

Sorry... but this is nonsense in its purest form.

>No, unfortunately I was too lazy to make the switch box so it's stuck in
>the most useful mode of ST-High ;)

This explains it. ST-High is the *only* resolution possible on these kind
of monitors. You may build a thousand switch boxes, there's no way you'll
ever get the Gateway or SuperMatch to display ST-Low and ST-Medium res.

>I think you'll find it's not as bad as it sounds. My 14" monitor recently
>started doing weird stuff in ST-High mode, I think because I didn't
>include the resistor in my adapter. It's certainly not a frequency
>problem though as the picture is perfectly stable until the monitor warms
>up.

Until the monitor warms up.... it's a common problem with older 14" colour
monitors, the refresh rate of the ST-High resolution at 71.5KHz is a task
which most of these monitors can't handle. In those days a VGA monitor
usally came with a fixed refresh rate of 60KHz, monitors which were able to
handle 71.5 KHz or higher were usally the expensive professional multisync
14" models. Nearly all monitors with fixed resolutions can be pushed up to
71.5 KHz for a short period (until they get warm).
Modern monitors are all of the multisync type now and 71.5KHz is considered
to be normal. Any modern monitor is able to display the ST-High resolution
perfectly.

Monitors which can display all three ST resolutions without needing some
sort of convertor haven't been build for the last five years. The Nokia
3360 17" model was the latest one AFAIK, that monitor featured a internal
TV, which explains the 15.5Khz option.

Some other suitable monitors which are able to display the ST resolutions
are:

Nec 3D
Philips 8CM 875
Hitachi 560

Sony 1480
CTX 1330
Conrac 7250
Teco TE 5155
TVM MS1414
Eizo 8060S (16")
Eizo 9060S (17")

>If the ST resolutions hurt your monitor, let me know, and I'll ship you a
>brand new 15" that will work fine for free.

They will not hurt his monitor, but he will not be able to use any of them
except for ST-High...

Cheers from Belgium

Hi Michael,
You might want to try Daimond edge or Cleanup.prg if you are booting
with ICD. I usually find that if one does'nt work then the other probably
will.

Since the latest MagiC-update now is 16 months old, it doesn't look like
they have something to look forward to either. It's sad, but MagiC seems
to be a PC/Mac-product only now.

Source record: 38496

Peter,

First off, you can send an e-mail to highwire at atari-users . net
(sorry for that, I just want to limit spam) that is the mailing list
address, but I will forward them to the group.
You can also post them on the bug tracking system,
http://highwire.atari-users.net/bugtracker/

But the forum access problems, can you explain them to me? What are you
using for a browser?

The bugs you have mentioned the team is aware of. It's a slow process
developing a browser and certain problems are being worked on. For example
the table routines need work, not all of the tags are properly
working/supported.

Like you did mention.. "But it's early days yet, and the files I have
tested display *far*
faster than in CAB." That's the whole point! We have a GREAT team
working on it, but they can only do so much. If anyone else wishes to
help... PLEASE DO! If you code in C, JOIN!!!

Just plug it into the TV, the modulator is built into the STFM (hence the
'M').

> Useless, useless, useless.

You clearly state in your original message "It powers up and I can connect
it to the computer,
but since I can't power the computer there's no way to know if it really
works."

So, do what I said, visit a local computer shop and buy a standard US power
cable for a PC. That will get your Atari working!
Then, you will be able to see the monitor working.

Most Atari's have the Operating System on chip inside, so you dont need anything else. BUT, a very few early Ataris needed the OS on a disk. Thats what I tried to say, sorry

> monitor was a GOOD thing, and then I find out that mono is better.
> Weird.

Color monitors on the Atari can only handle ST Low and ST Medium resolutions. The mono monitor only handles ST High, which has a bigger resolution. Most atari MIDI software only runs in ST High, hence the need for a mono monitor.

The best thing would be to get one of each, if you dont already.

Now, I hope that you don're reply to this with more of your witty comments, and foul attitude. I, along with other people, are trying to help you!

You should be able to connect it directly. The 'M' in the STFM means
that it has a built-in Modulator.

There is one relatively cheap and preety elegant solution for this problem.. I use it few years now: external (well can be internal too) tv tuner.. AverMedia JoyTV costed me 90usd, has TV tuner (TV and CATV programms) and video/audio input and output.. So basicaly all older machines and oldtimers works with that (either RF or composite or even RGB) Since tuner can be conected betwen monitor and computer u may just switch betwen computer or TV/whatewer. Remote controller as also included. Work nicely with any VGA/SVGA etc monitor without problem... also have teletext etc..

I'll start with this statement, and I'll ignore the "fucko" crack. If I wanted someone to come to my house and hand me a power supply and the cables I need, I would not have posted on Usenet.

> Your 520 ST will MOST LIKELY have built in TOS... GUI and all. You don't need
> to "warez" the OS to get it running.

Yes, well that was something I would have found out once I powered it up. The main gist of my post was "where can I get a power supply", and it was answered by "just plug it up and go". Anyone starting to see why I was pissed off?

> The power supply comes in two
> flavors. If you have a round power connector on the back, you need the
> "brick" style external power supply. If you have a standard IEEE plug,
> well... I think you know.

Ah yes, the aforementioned "kettle lead". Well I think we've deduced that I don't have the type that'll take a standard IEEE cable. If anyone wants to see me *really* flame someone, let them post that they need a power supply when it's a simple matter of grabbing an IEEE cord. I'm not THAT stupid.

> The Atari ST isn't a current production
> computer, you can't just waltz into rat shack and buy the stuff you need
> for it.

Really? Now who would be so clueless as to think 15- to 20-year-old computer parts would be available at any old retail outlet? Furthermore, if I was stupid enough to think that, why would I post on Usenet?

> And if you are missing so many cables, your absolute best bet

Which has 7 days left to go and will end at $100 because some guy saw
that Prodigy uses one and thinks it's "vintage".

> cost of a copy.

Warez, warez, warez! Any developers out there, please send me a free
copy of your program -- your work means nothing! Seriously though,
I'll gladly buy Cubase but I was under the impression that it was no
longer in development. First you remind me that the ST is not a
brand-new machine (no shit), then you say I'm pissing off developers
by asking for copied software. All I want is the program, and because
I KNOW that the ST is an antique, I figured there wasn't much chance
of buying an original copy of Cubase. In fact, I'm probably right
about that.

> Atari's have limited video memory. The more colors you display the more

> released for free. If you want to do anything, start there.

I'll check it out. I can't say I've seen a single link in anyone's
post, just a lot of ".uk", "tenner", "quid", and "cheerio old chap".
Okay, well I made that last one up.

> Your best and/or cheapest route for building an atari is to just buy
> another one. Unless you're so cheap you won't buy a computer for $10 or
> $20, in which case I can't nor will I help you.

Well let's see... I spent maybe $20-$30 on the stuff I have, so is it
incomprehensible that I'd want to just buy the cables instead of
paying inflated eBay prices and shipping "costs"? So I'm supposed to
respect the time developers put into software, but the money I've
already spent has to go out the window. Just gives me that warm fuzzy
feeling.

> Next time you ask for help maybe you should think and use a little
> patience. There's very many varying atari models, and people are giving
> you the best advice they can.

Okay, let's make a deal. Next time someone from Germany asks where
they can get a nice beer stein or that perfect swastika-print
bedspread to go with their sheet set, I'll tell them that in the U.S.
there's a mall that has everything they need, or that they can't use
their swastika-print stuff and instead have to invest in a complete
sheet-and-bedspread set in a nice "SS" print. When they flame me
mercilessly, I'll e-mail all those posts your way -- deal?

Bottom line is, I think I'll just add the ST the growing list of
machines I won't bother using because I have to deal with a lot of
quasi-elitist pricks. Besides, it should look quite nice stacked on
top of my Amiga.

Thanks for nothing.

Hm, I guess you are about 10 months wrong here. The latest 6.20 uppgrade
is dated 5/8-2001.

>they have something to look forward to either. It's sad, but MagiC seems
>to be a PC/Mac-product only now.

There is a common missunderstanding that no new versions means bad
software. Actually it's often the other way around. Good programs don't
need to be updated all the time. And Magic gets the job done. I still run
Win-95 OSR2 on my PC's and it does work pretty good too.

And computers do note perform any vorse when they get older. They are
just as fantastic as they were when you first got them for a lot of
money. Just compare with cars...

Svideo is just another form of composite video. The RF signal and composite video are two very separate thing. You'll need a small RCA to coax adapter from radio shack and then you can plug it into the cable jack on your TV. That should work fine, but you won't need the switch box. The STFM has composite out but you have to wire it yourself. If you wire it up properly, then you can use the svideo (which will look millions of times better)

I don't think there is a version number - the docs in the last version
I saw were 10th June '97.

I never did try to print from it either - I just use it as a very
quick viewer of a nice selection of file types.

I'm not sure Gembench shows memory, does it?
General and SI CPX's show the total memory and size of the largest free block in bytes. Profile does a little more and is probably a bit clearer.
Sysinfo shows the size of each fragmented memory block in adition to the largest free block, but in v4.01 (the only version I have) doesn't distinguish whether they belong to ST or TT RAM (I know this isn't a problem for the original questioner...)

Freemem.cpx is the only utility I know that'll distinguish between the fragmented blocks in ST and TT RAM - just in case anyone needs to know that kind of thing.

Quasi elitist pricks? Thanks for nothing? Hah. I gave you a wealth of information. One of the sites was run by an American, American company. They sold cables adapters all that sort of crap. Did you bother to look? No. In fact it's obvious you can't even open up google and do a simple web-search, then when people give you a mildly inflamed response when you're rude as hell, you just give up. And throw the atari on the pile. The fact is, you have proven my argument that you are extremely impatient, which was not led on through anything but how you behave towards other people. Nobody in here was trying to do anything but help you and give you a piece of their mind at the same time. As for the amiga, what do you want for it and what model is it? I'll buy it from you and you can take the money to buy cables from http://home.pacifier.com/~atari/catalogs.htm. Bravo sierra computers has all of the crap you were looking for. I was just trying to help you and save you some cash, not make you spend extra. The cables aren't standard and new and will be more expensive then a complete package deal.

Ordering IDE and SCSI adapters and everything else jsut to realize in the end the limitations the 520 ST presents you is rediculous. I thought you might want a relatively useful atari with an actual hard drive without spending in upwards of $1000 for it. Sorry about that. Perhaps next time I'll just call you a fucko and not waste my time typing anything else.

You are the uninformed idiot who managed to pick up atari computers without the parts that are required to operate them, and then you get all pissy with us because you realize how dumb you are? Grow up man. I gave you the resources, let's see if you'll use them. Get the parts and stop being a baby.

Dennis,

I do not remember all of that stuff being a part of KaosTOS. Maybe I am thinking of something else, or maybe I am thinking of an extremely early version of KAOSTos. What I had was TOS 1.4 on disk. I used to run it to give my 520 ST TOS 1.4

I tested these at work, and they are great. Composite input anfd VGA. I set one up with a switch box so I could use ST high, med and low. Good stuff. Does anybody have the pin outs for Mac VGA? I have a Nice Mac monitor to use with my Falcon.

>RF-Modulator or switch box (as I have heard it called).

You need a switchbox that can switch which signal (computer or antenna/cable) is going into your TV. These can be found at Radio Shack. Don't connect an RCA cable directly from the ST to the composite video jack on your TV as this will not work.

S-Video has a different jack configuration than an RCA cable, so it won't fit anyway.

Hope that helps. BTW, I assume you're in the US.

>
> All very well, but you won't get an unlock password for that HUGE archive
> unless you've contributed to the work.

I guess it depends on how you treat Robert (who is one hell of a guy).
AFAIK, if you register online, the password response is automated.
My most recent registration arrived in one day, and using the email
address I gave, he wouldn't have known me from Paul.....Most of the
Falcon hardware pictued was taken with my ScreenEye and Expose.
I haven't visited this group very often the last couple of years
because of all the misinformation about Falcons and Atari hardware in
general. Then it got really shitty with many personal attacks. Besides
Sinplop and Derrick Machacha, no one here deserves to be pounded on.
Well, maybe a couple of Pub brawles <grin> were deserved, but nothing
like what has go on here the last few years. Consider yourself
chastized.
But I will agree, it is a huge archive. Surely needed it if one is
going to play around with a Nemesis anyway:)
I would scan mine, but Epson hasn't seen fit to release new drivers
for the ES1200C for the last few versions of windows.
With my pea brain power, I finally managed to figure out how to run a
server from home. The hard disk access is slow (Quadra 800), but the
site runs over a cable modem and Linksys router. My friend just tested
out the HTTP port and it seemed to work great. The problem with home
sites is maintaince, power outages, and being on a DHCP server, runs
the risk of the IP changing (however the modem hasn't been shut down
in a month and has kept the same IP).
Maybe I'll put the manual up soon, maybe not. The manual use to be
available on line at Daves place.
Or from my notes:

Mike

NEMESIS SYSTEM ACCELERATOR
Last edited 18 Apr 97

Updates and corrections to manual

==========
FIRST AND MOST IMPORTANT - READ THIS TEXT FILE AND THE MANUAL
THOROUGHLY BEFORE STARTING WORK ON THE NEMESIS UPGRADE.
==========

Nemesis is copyright 1997 Black Scorpion Software Limited.

==========
GETTING NEMESIS FITTED
==========

If, after reading through the manual, you decide it is a little heavy going(!), contact TITAN DESIGNS for more information on the available fitting services.

The following questions really need answering first;

1. Type of memory fitted? See below.

2. Type of IDE drive fitted? (if any)

3. Is the capability of support for RGB monitors required?
- this is an optional extra costing only ï¿½5.00.

4. Hard disk driver software used?

- AHDI and HD Driver are fine. The only problems to date seem to be with some versions of ICD software, although we have not been able to determine exactly what the problem is.

If you do decide to get Nemesis fitted by someone recommended by Titan Designs, please ensure that payment for the fitting service ONLY is to the
person or company performing the upgrade - we will advise on this.

If you have a Desktopper-style case, then we would much prefer to receive
just the motherboard, the IDE drive and the floppy - we do not like these
cases and dismantling them is very time-consuming. If you do decide to forward the complete system, with case, then an extra ï¿½5 will be levied
for handling charges.

This additional levy (ï¿½5) also applies to owners of recased Falcons, except for the C-Lab MK.X.

IN ANY EVENT MAKE SURE THE COMPUTER IS PACKED EXTREMELY WELL!!! Titan Designs or it's agents cannot be held responsible for any damage sustained
during transit.

Sending on the IDE drive is preferred but not essential. The reason for
this is because we would prefer to test the complete fitted installation

and ensure that the software is correctly configured. It has been noted
that some large IDE drives do not work with Nemesis running at 48MHz or
sometimes even 40MHz. This situation is rare.

External SCSI drives need not be forwarded.

==========
3.1 PACKAGE CONTENTS (page 6)
==========

Only the 150pF capacitor is supplied as we have yet to find a Falcon which
needs the 82pF device.

==========
INSTALLATION OVERVIEW (page 7)
==========

- FalconWing Memory Boards

If you do have FalconWing fitted or any other memory upgrade board that
uses 30-pn SIMMS, these are almost certainly NOT SUITABLE for use with
Nemesis. The design of the FalconWing PCB creates an unacceptable amount
of video noise to the extent where the screen is unviewable.

Solution: Not an easy one this... You could try to sell on the 4 x 4MB,
30-pin SIMMs to a PC or Mac user (providing their machines still support
these SIMMs), but they are not in great demand.

- Original ATARI 14MB memory board

NOTE: This ONLY affects the original Atari 14MB memory boards, with memory
chips rated at 80ns. These boards produce a similar effect to the
FalconWing and, while not as bad, can still produce very noisy screens.

Solution: As with the FalconWing - not easy... You really need to find
another Falcon user who won't be having a Nemesis board fitted!

Contact Titan Designs for the best price on SUITABLE 14MB memory upgrades
- we only use 72-pin, 60ns EDO Panasonic TAB SIMMs - the very best!

==========
5.4 Preparation
==========

Please note the following;

If an existing buffer mod. is fitted to your Falcon, this will need to be
removed. Normally these are fitted across the GAL, U63.

If a Power Up2 is installed, then it will be necessary to remake a solder
junction. This can be found just in front of the PSU and is marked
'U46'.

Locate the fourth (4th) set of pads from the LEFT and remake this
joint.

It is also possible that this juncton has been broken at some time in the
past, therefore it is worth checking as a matter of course.

==========
6.3.2 Continuous black screen (page 14, 2nd para.)
==========

The mention of "... moving the BLUE wire to the TOP of R217..." should
read; "... moving the BLUE wire to the *BOTTOM* of R217..."

3rd para.

Should read; "The installation can now be *retried*...". Silly typo!

==========
7.2 LOCATION (of the Nemesis board - pages 18/19)
==========

When mounting Nemesis inside a standard (not recased) Falcon, we do
recommend that the fan is removed and replaced inside the top metal
shielding. Nemesis is then mounted above the vacant hole.

However, do not use the solder pads (used to mount the fan bracket onto
the Falcon motherboard) as ground points for Nemesis - these are not
connected to ground at all (caused us a few panicky moments!). Use the
outer rail of the Falcon motherboard instead.

These solder pads do make a very solid joint from which to mount Nemesis
(using a paper clip is ideal!) - just don't rely on them for
grounding.

==========
8.1 IKBD PATCH (page 20)
==========

Item (d) mentions that "some" Falcons benefit from having both pins 3 & 4
lifted and joined. It now seems that "ALL" Falcons work correctly

having
this mod. done, and this can be considered the *only* method. The
diagram
at the bottom-right of the page is also incorrect in this respect.

sub-section (k) (page 21)

The thick red (power) wire on some Nemesis boards might be too short
to
reach the positive (+) pole of C147. This will mean lenghtening the
wire,
however make sure that any solder joint is well insulated!

==========
8.2.3 If the machine boots up normally... (page 23, 2rd & 4th para.)
==========

Ignore this reference - the IKBD chip should have BOTH pins (3 & 4),
lifted and connected together, as mentioned above (8.1).

==========
9.2 ACCELERATING THE DSP (page 27, sub-section (d))
==========

"Solder the BROWN wire to the newly exposed PCB track", should read
"Solder the *YELLOW* wire to the newly exposed PCB track.

==========
9.3 DOUBLE-CLOCKING THE FPU (pages 27/28)
==========

Under certain circumstances, we have discovered that some later
revision
motherboards cannot cope with the FPU being double-clocked -
irrespective
of the speed of the FPU.

Unfortunately there is not a solution to this problem and it will be
necessary to revert back to using the ORANGE wire from the Buffer
instead.

This will still permit an FPU speed of 20 or 24MHz depending on the
Nemesis setting.

==========
10.4 RGB SYNC FIX (page 30)
==========

The VGA Sync bug mentioned refers to tiny 'flecks' that can sometimes
be
apparent on some VGA monitors (in the main, inexpensive 14" VGA seem
to
suffer most).

```
==========================================================================
11.1 REFITTING FAN (optional for Std. Falcon users - pages 30/31)
==========================================================================

We do realise that it's impractical for most people to have a bench
mounted pillar drill with a 38mm hole saw(!), but using this method
does
ensure that the components inside the Falcon do remain adequately
cool.
Contact Titan Designs if you require this modification done.

PLEASE NOTE:
The mounting holes for the fan detailed in the diagram are incorrect.
They
should use the top-right and bottom-left holes in the metal shielding.

Please contact us if you're unsure about this part!

==========================================================================
12 SOFTWARE (pages 31 to 33)
==========================================================================

All updates to the Nemesis software are freely available from our new
Web
download area (see the foot of this page for the URL).

==========================================================================
12.3 & 12.3.1 NEMESIS SPEED SETTINGS (page 32)
==========================================================================

All the Nemesis software switches are now PRG files, not TOS, and can
be
placed in the AUTO folder as desired.

==========================================================================
12.5 SPEED DETECTION (NEMESIS.PRG (page 33)
==========================================================================

Last sentence should read;
"Placing NEMESIS.PRG as the first file after the Boot Manager (if
used),
will assist in speeding up the AUTO-loading process in conjunction
with
the NEM_HI or NEM_LO software switches."

==========================================================================
APPENDIX 1.1 GENERAL SYSTEM STABILITY (pages 34/35)
==========================================================================

We cannot really emphasise enough the need for SOLID ground
connections.
We have discovered this can have a marked effect on the stability of
Falcons, so if you are getting some odd results with Nemesis installed
try
fitting additional ground points from the Nemesis PCB (the 'e' points)
```

to
the outer rail of the Falcon PCB.

==========
APPENDIX 1.2 SCSI & Audio DMA Problems (page 36)
==========

Ignore both items (b) and (c). The 82pF is not included and you should only need to use the 150pF capacitor.

Fitting an Afterburner to a 'Nemesised' Falcon is an exception to this rule and further advice will need to be taken from Titan Designs/BSS.

==========
ADDENDUM - NEMESIS PRINTING (page 39)
==========

The mention of Nemesis printing problems, in the ADDENDUM, appears to be
related to the MagiC OS only, and does not seem to affect other OS configurations.

To get around the problem inside MagiC, switching the Nemesis clock value
to 20/40MHz does permit printing under these conditions. If/when we have a
suitable fix for this problem it will be posted on the various BBS and on-line conferences - sorry if you haven't got a modem yet!

==========

Apart from all this very necessary gumph, have fun fitting Nemesis and we
feel sure that you'll enjoy all the benefits that it offers!

Remember we are only a phone call away, so if you need any further assistance, FIRSTLY RE-CHECK THE INSTALLATION TO MAKE ABSOLUTELY SURE THERE ARE NO ERRORS and, if this doesn't reveal anything, please contact;

==========

NEMESIS.PRG,NEM_HI.PRG & NEM_LO.PRG go in your auto folder.
NEMESIS.PRG

must be before the latter two. If you require a 40MHz system clock
enable
NEM_LO.PRG & disable NEM_HI.PRG. For a 48MHz system clock enable
NEM_HI.PRG
and disable NEM_LO.PRG. You can also run these switches from the
desktop
NEM_OFF.PRG switches back to a standard 32MHZ system clock.

HRTC.PRG patches the 40 column double line off mode to provide a
640x480
true color resolution. This should go in the auto folder after NVDI
(if
installed) noting that the mode will produce garbage if Nemesis is not
on the 48MHz setting.

NEMBENCH.TOS & DSPBENCH.TOS are simple benchmark programs for the
CPU/FPU
and DSP respectively.

Nemesis Programming Notes

Nemesis accelerates the entire Falcon system by 50% therefore most
software
will run without modification. There are, however, some pitfalls to
avoid.

In common with all system accelerators, Nemesis modifies the system
clock.
Since this clock supplies the 32MHz dot clock to the Videl chip this
signal
will be 32, 40 or 48MHz depending on the status of the Nemesis
switches.
Software which depends on the system clock being 32MHz, or requires a
32MHz

dot clock to provide enhanced resolutions, will fail. Obviously this affects
RGB users most because RGB resolutions use the 32MHz clock.

A switch has been provided on the Nemesis board to allow the 25MHz clock to
be replaced with a 32MHz one. This allows the Falcon to be accelerated with
an RGB monitor and still produce sensible video. For this reason it is
inadvisable to change the dot clock when setting up the display using the
hardware registers while running on an RGB monitor. Either retain the current
dot clock or use Vsetmode to change resolution.

Avoid using instruction sequences to provide delay loops in timing critical
code. Any FOR ... NEXT type construct will take 33% less time when Nemesis
is running at 48MHz regardless of language. Use the MFP timers for accurate
delays. This one applies to any accelerator.

That's it. Generally any software which is completely clean and doesn't set
up it's display using the hardware registers will work perfectly well.

[H]igh [R]es [T]rue [C]olour

HRTC.PRG should reside in your auto folder after NVDI if it is installed.

This patch program provides access to the quarter pixel, true colour VGA
modes made possible by Nemesis. It does this by patching the 320 x 480
mode to 640 x 480 - select 40 column, double line off and true colour from
the dialogue provided by the desktop Set Video dialogue.

Users of Videlity do not require this patch.

I checked out the Averkey website and the JoyTV page, and it doesn't list RGB as an input signal. Am I missing something here? How can you get ST med and low without some type of RGB to composite/svideo converter?

This looks interesting though for PC/Mac users.

>I tested these at work, and they are great. Composite input anfd VGA. I set

How do I find out what desktop I am using? I am brand new to the falcon and the st line of computers so I have no idea what I am using. The folders don't let me go any level it says "UL" with two dots over the U.

That's the release date. The last *update* is dated 2.10.2000, and
that was a small bug-fix in the iconify-handler. The last change
before that again was in early february 2000, two years ago. This is
the 6.20 MagiC-update available from ASH's website.

That's true, MagiC isn't bad just because it's not updated anymore.
But for the average user who always wants more features, there's not
much to look forward too, which was my comment to Dennis' "don't look
back"-statement ;-)

| . . . . .
| You all appear to be working in the colour (medium res type) mode.
|
| You need a special lead to put the TT into TT hi res, 1280 X 960 I think.

| . . . . .

TT Hi uses emitter coupled logic (ECL) and needs to be used with a monitor
with an ECL input. The result is very good.

Do American STs not have a TV connector? The UK STFMs do - so that's
what I was assuming.

Well if ST has RF it also has composite sync signal, if dont (except
STE's, they usualy have composite even if no RF) there are RGB<>composite
adapters.. composite is also names video signal...

You dont need any electronics to convert a seperate RGB/Sync signal to a
composite. Just twist all the wires together (obviously not the grounds) and
there you have it, a composite signal.

I'm using Ws with a PPP connection without any problem. It's a 3.30c
version. All I set up is login, password, DNS 1 and 2, script in
auto mode without any variable set in the Script page.
And the connection is working wonderfully (not like all the features
of Ws :( ).
Some older versions of Ws might require script. Please could you
precise the version you use, I have all the version of Ws so I could
check one of them and try to get the correct parameters.

Regards.

There are several desktops available, but you likely have the built-in
TOS. The way to find out is, just after booting, to look at the first
entry in the leftmost pulldown window.

As for your umlauted U-L, it is probably a corrupted folder. Remove
it with disk editing software, or copy everything to another
partition, reformat the partition, and copy back. Always take great
care to back up your entire hard drive before playing with partiioning
software!

Another CPX that works well is HDSPACE.CPX (at least, I THINK that's
its name). While it is intended to tell how much hard drive space
remains on each partition, it very nicely also tells you how much RAM
you have installed and remaining for use.

Hello,

Control-A also gets you to the menu you are talking about. I still
think that 1stGuide is intened to be a viewer. The printer options, I
think, are there to adjust the print mode, but nothing else. Sort of
like how NVDI is used. I can set NVDI to print in Mono, so when I go
into Calamus SL (which uses NVDI) and try to print, the settings will
come out to print in Mono and cannot be changed.

ImageCopy should be able to do the job, if you want, email me the image
and I will see what I can do.

Brent,

That's funny because the DVD players only have composite video, meaning that if you wanted to hook it to an RF jack on the tv you would need Radio Shack's $30 RF modulator box (which they usually have 80+ on hand at a high volume store). This would take the audio and composite video and put it into one coax cable and you'd tune either channel 3 or 4 on the TV. What you'd want since the Falcon/ST has an _RF_ out is a simple RCA to COAX adapter located in the elctronics section. Just in a little bubble package, less than $5. Tiny little metal device, not large box.

Remember EVERYONE..
RF == the jack on the back of the TV
composite video is different. That signal out of the falcon carries sound and everything, and is tuned to channel 3 or 4. Composite video signal has no "channel" nor does it carry sound..
They are two DIFFERENT things.

(Brent I am not yelling at you. just seems like everyone else is misinformed in these things)

Joseph,

If you can't negotiate a session with a terminal program, then they
probably use PAP or CHAP authentication, which are not human readable.

What do you see when it connects (with a terminal program).
I know iconnect supports PAP and I think STiNG does too, which would
explain why they work and wensuite does not.

Chris,

Yes they do. He was talking about an S-Video connector on the TV. S-Video is similar to composite video (and easily adapted between one another). However the jack on the back of ANY ST is not composite video, it's RF. Meaning he would either need to wire up his 1040 to add an additional jack to get composite video which he could in turn wire to the svideo jack on his tv (which would produce better results), or he would get an rca cable and then a little rca to coax adapter to put on the tv, where the antenna hooks up. Then tune the tv to channel 3 or 4.

I was just trying to specify that he is trying to hook RF from the ST up to composite (svideo) on the TV and that combo does not work without electronics in the middle ;)

Yes, you're absolutely right. I went down to the local Goodwill and saw a complete ST system sitting there. I grabbed that there kay-board (thats-a what make dat dere cumputer werk don't it) and there was sum brick-lookin' thang next to it and I just left it there. Then ah pulled sum wiry thing outta the back of da disky drive thingy cuz it looked like a snake and I left that there and took the cute little boxy disk thingy cuz it'd look cute as a paperweight and cuz I is stupid as shit.

LOOK YOU FUCKING PRICK, DO YOU HONESTLY THINK I'D CHOOSE, OR BE STUPID ENOUGH, TO BUY AN ST WITHOUT THE CABLES AND POWER SUPPLY IF I HAD A CHOICE?!!!! WHEN YOU FIND STUFF AT GOODWILL FOR 5 OR 10 DOLLARS, YOU TAKE IT ANY WAY YOU CAN GET IT!!!! I CERTAINLY HOPE YOU DON'T CALL EVERYONE WHO POSTS LOOKING FOR MISSING PARTS AN UNINFORMED IDIOT!!!!!

You just proved my point about quasi-elitist pricks on these newsgroups. The Amiga is an A1200HD/40 but I'm not selling it. I can no longer find a use for it, but it doesn't mean I want it gone. It will just have to sit with my dormant ST until I happen to find the parts I need.

Huh? Maybe I'm missing something here. You're telling me that all one has to
do is solder the red, green, blue, horizontal sync and vertical sync pins into
one wire, and that one combined signal wire sends out a composite signal? Even
without an RF modulator in the ST?

Sounds too easy. Has this been tried?
(I'm not an electronics expert, but I can build cables :-))
.

Interesting,

PAP and CHAP actually will not appear without sending a packet. i.e. it will send out that text prompt but your machine when connecting would start sending ppp garbage and their terminal server would be listening for it. I would assume that is how authentication is done properly, but at this point I don't know what to tell you.

Well,
there is no need for you to read them. Just ignore them, if you do not
like them. For me (sitting in Germany) they are of interest from time to
time, i.e. when reading something new (special offers, price reductions,
etc.) I visit his homepage and take a look at it. Sometimes I even order
something (or let some friends order something for me). After all, I am
happy that there are still some atari dealers/vendors left and why not
let them do some adverts ?!?
Especially why not let them do some adverts in the atari newsgroups ?!?
I personall don`t mind... -Andreas.

NVDI only supports the ET4000-AX graphic processor, there's also a ET4000-W32
graphic processor available which contains a hardware accelerator, but the
latter is not supported by the NVDI driver.

>Where could I get ISA to VME interface?

AFAIK nowhere :-(
NOVA were the only one to produce these interfaces, they were never sold
seperately but as a complete package with the ISA card and drivers. Copying the
interface IMO is not possible, the design is straightforward but right in the
middle of the interface there's a nasty looking GAL lurking....

Cheers from Belgium
Dennis

Hi Mark,

>I do not remember all of that stuff being a part of KaosTOS. Maybe I am
>thinking of something else, or maybe I am thinking of an extremely early
>version of KAOSTos. What I had was TOS 1.4 on disk. I used to run it to
>give my 520 ST TOS 1.4

AFAIK KAOS was only available in Germany which explains why it's relatively unknown, note that it's KAOS, not KAOS TOS... KAOS stands for Kromke Andreas Operating System....
KAOS could either be loaded into memory where it replaced TOS completely or put permanently in the computer by replacing the TOS ROM with KAOS ROM. To load KAOS into memory one needed a little bootprogram that loaded the image. Note that magxboot.prg is essentially the same thing...
So what you had on the TOS 1.4 disk was the little bootprogram that booted the TOS 1.4 image, with this little bootprogram TOS 1.2 and 1.4 could be loaded into memory where they remained until the computer was switched off, the advantage of using the KAOS bootloader versus an IMG bootsector was that TOS became resetfast, that was another novelty in those days.

Cheers from Belgium
Dennis

Hi Jo Even,

>>seriously in those days replaced TOS and never looked back... and the real
>>clever users upgraded to MagiC later on and until today still never had to
>>look back :-)
>
>Since the latest MagiC-update now is 16 months old, it doesn't look like
>they have something to look forward to either. It's sad, but MagiC seems
>to be a PC/Mac-product only now.

Would you care to elaborate on this a little further? I wrote that MagiC
users never had to look back until today, I haven't got a crystal ball so
predicting what we've got to look forward to is not my cup of tea, but being
realistic I would say you're absolutely right.
The last free update for MagiC is only six months old, and even if it would
for the sake of argument be 3 years oldM so what? I'm not aware of any recent
released apps which don't run under it because MagiC is outdated... do you?
You do realise that N.AES 2.0 and Thing 1.27 are getting on a bit also? And
contrary to the MagiC stuff it *shows* ;-)

The MagiC PC/Mac versions are exactly the same as the Atari version, the main
difference ofcourse is speed, if processor speed is the most important factor
for someone to switch platforms, then I'm you're right once agin.
But TOS, Geneva, MagiC and MiNT users alike will all migrate to a different
platform when they need to run apps which are not available for this platform
or even if they simply need more power...
It doesn't matter what OS someone use, please realise that *WE* have not a
lot to look forward to on this platform. Some may think differently, but
plonking a quite expensive 68060 upgrade board into a by today standards
ancient Falcon is not really what I would call "moving on".
We're all in the same boat, regardless which OS is used :-/

Cheers from Belgium

Hello,

I'm not having any luck connecting the ICD Link 2 SCSI adapter to my STe. When I run the ICD software I get the following error:

No ICD Host Adapter Found -Caching disabled.

Also, the LED on the adapter does not light, indicating it is not receiving power.

Even worse!, I called ICD and they no longer can do any repairs.

Is it possible to test the DMA port?

Any help appreciated,

HT> in English at all?

I've been using Guck for years, in english, and under Magic. So long
now that I've forgotten the details of how I installed it, but I have
some lines in my MAGX.INF file that determines that it replaces the
Magic (or in my case, Thing) desktop viewer. I think the relavant
line is:

#_DPG C:\AUTOSTUF\GUCK18_E\M-GUCK.PRG (or it could point to wherever
you put your copy, I just happen to have a folder that I
called AUTOSTUF for, well, Auto folder stuff.)

which appears near the end of the file. M-GUCK is the version that
works with Magic.

Here is a copy of the ReadMe file that has lived in that folder for
the last several years:

From: Steve Wells <wells_s@kosmos.wcc.govt.nz>
Subject: Guck english programs

I have translated the programs, not the documentation.

This file contains:

GUCK.PRG (v. 18b, TOS 2.**+ and MultiTos compatible)
M_GUCK.PRG
INSTGUCK.PRG
INSTGUCK.RSC
EPSON.CFG

GUCK may be run as a .TTP or as a .PRG. For a multitasking environment, GUCK run as a .PRG passes the file(s) to M_GUCK.PRG, to disable drawing with the mouse and prevent "mouse droppings". M_GUCK must be in the same directory as GUCK.

The installer program, INSTGUCK.PRG, has on-screen instructions for its use, and GUCK has a list of its commands called up by the HELP key.

Regards,

| Read this carefully... I CAN'T DO THAT!!!!! Jesus Christ, how
| clear can I make it that this does not use a standard IEEE "kettle
| lead" power cable? I AM NOT THAT STUPID!!!!! I have plenty of IEEE
| power cords around -- they will NOT work with the 520 ST!!!

It sounds more like you have a very early ST that had an external power supply, if so the only answer is to track down a PSU or obtain a later PSU and graft that in by tracing the connectors internally and comparing requirements to the donor organ.

Has anyone here ever grafted a later ST PSU to a shoe box machine.?

Hi

| I'm not having any luck connecting the ICD Link 2 SCSI adapter to my
| STe. When I run the ICD software I get the following error:
|
| No ICD Host Adapter Found -Caching disabled.
|
| Also, the LED on the adapter does not light, indicating it is not
| receiving power.

This is a bit of a clue, is it plugged into a hard drive, that is what supplies its power, via the trmpwr line, no trmpwr or no drive for that matter gives no light, hence it cannot be seen by the Atari. Check basics first.

| Even worse!, I called ICD and they no longer can do any repairs.
|
| Is it possible to test the DMA port?

I dont think its that serious.

Dennis Vermeire <dennis.vermeire@gmx.net> wrote:

> The last free update for MagiC is only six months old, and even if it would

What kind of update was that? The last I've found is the one on ASH'
website, and the last changes to that archive was done around 16 months
ago.

> for the sake of argument be 3 years oldM so what? I'm not aware of any recent
> released apps which don't run under it because MagiC is outdated... do you?

Ofcourse not, and that wasn't my point either. I guess people upgraded
from TOS via KAOS to MagiC for a reason, and that was probably the added
features in MagiC. I don't think people suddenly don't want new features
anymore, hence my comment that while MagiC-users hasn't looked back since
1992, there's now nothing to look forward to either.

> You do realise that N.AES 2.0 and Thing 1.27 are getting on a bit also? And
> contrary to the MagiC stuff it *shows* ;-)

I don't want to start yet another flamewar on this topic. Yes, I know that
N.AES hasn't been updated in ages, and I really don't care either (looking
forward to XaAES). And while I have much more recent versions of Thing
than 1.27, I realize that Thing is a dead end too. I'm not happy about
this, just like I'm not happy with the death of MagiC as a supported
product.

> We're all in the same boat, regardless which OS is used :-/

That's true, although the fast development of FreeMiNT and XaAES suggests
that there's still some life in this platform.

Why?

The 'power' comes from the hard drive, not the STE........

RTFM.

Hello,

Did the hard drive work before you tried it on the STE? If not, it could very easily be the hard drive itself. The link takes power from the SCSI device, and only lights when recieving power.

If, and it's a big if, the drive works as it should, but the STE still cant see the Link, then you may have one of the early STE's with a faulty DMA chip. This is quite easily fixed, and can be done either by Atari Workshop in the UK, or Best Electronics in the USA.

Hope any of this helps you

Best of luck

Simon

There seems to be a bit of an attitude problem on this group recently

Please, lets try and keep friendly, and helpful. Sarcastic remarks, flaming, and pure abusiveness doesnt do anyone any good, it just makes things in here unpleasent.

But if you feel you must be abusive, or make a foul comment, then please do it elsewere.

Thanks

Simon

Hi Rob!

Many thanks for the quick reply - and very useful too.

>But the forum access problems, can you explain them to me? What are you
>using for a browser?

Using CAB. When I tried to access the forum, it crashed on me.
Could be a one-=off - I'll try it agfain sometimes.

>The bugs you have mentioned the team is aware of. It's a slow process
>developing a browser and certain problems are being worked on. For example
>the table routines need work, not all of the tags are properly
>working/supported.

Understood. I just though that feedback would be useful in case it
hadn't been discovered/reported yet. May I suggest that in the
History.txt you include a section 'Yet to be done' or something
similar.

A suggestion: It would be nice if you could scroll the main panel
from the keyboard (perhaps have to select the relevant panel first
with a click, if this is possible).

It might help all concerned if you could specify what the power socket at the back of the computer looked like. Atari was usually quite good at putting labels/icons on all inputs and outputs. My old 520ST, which used an external supply, has a round socket with 7 pins and the word Power underneath, and an icon above consisting of a horizontal line with three short dashes beneath. (The icon means nothing to me - but, then, icons often mean nothing to me. You should see the ones on our new lifts.)

What is on the back of our computer?

Hey man,

The ICD Link/2 needs to get it's power from the SCSI bus. Meaning whatever
you hook up to the SCSI bus, at least one of the devices has to put out
power to the scsi bus. Most hard drives do, or have a jumper to turn it
on. Zip drives are one of hte few things I know that do not, period. If
you aren't hooking anything up to the link, it will not work ;)

725. Misc ST Items and More FS

Newsgroup: comp.sys.atari.st
Date: 2002-01-30 00:55:31 UTC
From: Fred Horvat <fmhcom@operamail.com>
Message-ID: <7wH58.151$5y.105365@newsfeed.slurp.net>
Source record: 38473

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

---
60 Meg SCSI external drive in a nice 9.5" x 9.5" x 2.75" case.
Has 2 SCSI 1 connectors allowing passthrough.
Comes with SCSI 1 cable. $60.00

Syquest 44 drive with 1 44 Meg Cartridge and ICD Link.
Drive comes in nice shoebox style case with integraded ICD Link
allowing simple plug and play to ST, STe, and TT. Comes with one
HDX formatted 44 Meg cartridge. There is room for a second
hard drive or even a CD-ROM drive. Has a male SCSI 1 connector
cable already wired. $100.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

Bridge 4.0 by Artworx. Play the card game Bridge on your ST.
Comes with disk, docs, and box $5.00

Renegade by Mastertronic. A space shooter type of game kinda
like Star Raiders? Comes with disk and docs. $5.00

Captian Blood by InfoGrames. A Space Adventure game. Docs state
"This software explores a new concept, the BIO-GAME. The characters
can evolve, be born, die, trade information and generally get on
with their own independent lives." Comes with disk, box, and docs. $10.00

NightBreed by Ocean. This is from Clive Barker's Nightbreed story.
"Make your way through the caverns of Necropolis to the underground
city of Midian and where Nightbreed creatures dwell." "This all
action adventure allows you to shoot, punch, and jump as you
explore the terrifying underground environment of Nightbreed."
comes with disks, docs, and box. $10.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.

For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Geneva by Gribnif Sotware. Multitasking Application Environment
software. Give your ST, TT, or Falcon true multitasking
operating system. Can operate on a standard ST with 512K RAM
but more RAM is preferred. Comes with manual, disks and box $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

MAGAZINES

I am working on a huge list of Atari and Classic Video Game/Computer
list. Please E-mail on what I have at the moment.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

The Complete MINT by Whiteline. Over 330 meg of MINT related software.
Has MINT kernels, MINTNet, X11, C++, Internet files and more. $15.00

WANTED

MagiC Mac Ver 6.XX
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

Simon,

As he says the LED on the Link2 doesn't light up, it's unlikely to
be the DMA chip.

As has already been stated earlier, the drive has to have
'termpower' enabled, which is switchable on some drives. Termpower
supplies +5 volts to pin 26 on the standard SCSI connector and the
Link takes its power from that. On most drives this can either be
enabled with a switch or with a jumper. I had one old drive (from
a server) that didn't have termpower, so I soldered a small
silicon diode between the +5V on the power plug and pin 26 (which
is usually the one oppposite the notch on the SCSI connector -
make sure it's not the 'earthed' row) and it worked fine with the
Link 2.

It would be better to put a small (100 or 500 mA) fuse in series
as well, just for safety's sake. The diode is also a safety fature
- it prevents 5V being fed back if some other device on the SCSI
bus also supplies termpower.

Regards, /Peter/

Agreed. For the record, when I encounter abuse, I simply stop reading
the post. If others do the same, this would explain why some people
don't seem to get any assistance here. It's a pity, too, for there is
a wealth of knowledge in this group.

Ive read the FAQ but didnt read anything about the problem Im having. I have a 520STFM with TOS 1.04 and 2.5 megs. The computer work fine but, when I try to use Notator with the dongle inserted into the cartridge port the system stops responding the mouse will not even move. The software and dongle work fine on another 1040ST with out a memory upgrade. Ive also tried TOS 1.0 and I still have the same problem. Anyone have any ideas?

Thanks,

Don

I agree. I generally find the Atari newsgroups (and community in general) to be a refreshingly helpful and supportive environment, especially when compared to the Amiga and Macintosh groups.

I found that I was dialing a different number than I usually dial with my
ST. I thought all the numbers would respond the same, but when I dialed
the one I usually dial with the ST, I connected. Very strange. Perhaps
they are using different types of modems on different lines.
Thanks for your input!

733. Casio CZ 101 and Atari ST programming HELP!

Newsgroup: comp.sys.atari.st
Date: 2002-01-30 11:20:34 UTC
From: parris_k@yahoo.com
Message-ID: <aa5c37da.0201300320.584c91b8@posting.google.com>
Source record: 38482

Seeing as I am right on the cutting edge (for 1990) I have decided to reinvent the wheel and write my own voice editor/librarian program for the ST. I am well aware that there are already many editors/librarians for the ST, but I thought it seemed like fun (and a learning experience) to do my own.

The first problem I have encountered is that the CZ is supposed to spit out 256 bytes of data when asked for the current voice parameters, followed by F7. My skeleton program only seems to receive 128 bytes and no F7.

Conclusion I have come to so far is either:

The cz101 is not responding correctly
OR
The ST is losing some of the bytes sent by the CZ.

DOes anyone have any detailed knowledge of the behaviour of the MIDI ports? I am currently just monitoring the status of the port with Bconstat(3), then when a character appears at the port I read in a loop (with Bconin(3))until Bconstat(3) returns 0, indicating there are no more characters. Presumably, there is only a limited buffer associated with the MIDI port (although I imagine it's larger than 256 bytes), so there is a possibility that data can arrive at the port faster than it is being read, which would presumably lead to a buffer overflow and lost data.

Can anyone recomment a failsafe method of reading all the data from the port? Or should my code achieve that anyway?

thanks in advance

T

If you are using ASM, C, or even GFA basic a loop to read the midi port would never be too slow causing a buffer overflow. Midi data is sent on a fixed baud which is incredibly slow. Unless that is your using some sort of interupt handler to call Bconstat, Ie Vblank, which fires once every 50th or 60th of a second, then there is no way you would lose data, but I dont know why you would do that.

If your loop is something like this:

```
:loop1
if no data goto loop1
:loop2
get byte
inc array (or buffer/memspace whatever)
if data exists goto loop2
```

This can be implemented in ASM in a very small piece of code. Even in Basic it should run fast enough that you ever miss a byte. In which case I would either suggest that you double check the code request that you are sending to the CZ, or even get another CZ dumper from shareware and watch its behaviour.

The only other thing I can think off is a dodgy midi lead but I dont think that would do this.

735. editing .RSC files for ST low rez.

Newsgroup: comp.sys.atari.st
Date: 2002-01-30 12:08:58 UTC
From: "D.W. van der Burg" <D.W.vanderBurg@student.tudelft.nl>
Message-ID: <3C57E259.B7E03674@student.tudelft.nl>
Source record: 38484

Hi,

I am editing some resource files so that the menus will fit on the screen when in ST low resolution. With a resource editor, I can shift the desktop items (for example: 'desk' 'file' 'view' ... 'options') to the left so that they fit into the width of the screen (320 pixels).

When I then run the program with the modified resource file, a part of the drop down menu of the rightmost desktop item wraps over the right edge of the screen, appearing again on the left side....

In the resource editor, I would thus like to shift the drop down menu of the rightmost desktop item to the left (while the position of the desktop item itself remains fixed), so that the menu will fit on the screen. For example this has been done in the GEM desktop with the 'options' desktop item. Does anyone know how to do this with Interface or Resource Master 2.11?

thank you,
Dennis

> or Resource Master 2.11?

1. select the menu tree
2. change the tree type from "menu" to "dialog"
3. Now you can move the menus to the left
4. change the tree type back to "menu".

That should be enough :-)

Greetings,
Matthias

Message-ID: <3C5822BA.BF54EDCA@chello.nl>
Source record: 38486

There is a new version available on my homepage (url in sig)

1 Less uglier logo.

2 Fixed a small inconsistency in the hiding mechanism.
This affects windows that are partly outside the left side of the screen.

3 Fix in unhiding after a app terminates.

4 Bug in the debugger ;-). Default debugpoints got lost. Fixed.

5 Nice arrows for sliders.

6 WF_SCREEN buffer handling improved. See history file.

7 Implemented a simple and mostly safe shut down procedure.
It uses the task manager. See history file.

8 Apps that issue multiple appl_init/exit pairs run again.
Notably LINES & PRGFLAGS

9 The taskmanager is now also updated when creating clients.
New config command:

open taskmanager

The taskmanager is opened as soon as possible in bootup.
Nice demonstration.

10 Implemented sizing by grabbing any border or corner of a window.
The window must be moveable AND sizeable.

New operand to the option 'windows'

thickframe

The most outer frame of a window will be 1 pixel wider.
Makes it just that easier to grab the border.

NB!

The folder 'widgets' has a lot more widgets.
Newer were supplied by Patrick Prokopowicz.

The source distribition comprises a surrounding folder 'XAAES940'.

Indeed, for a user with a ST and a limited amount of RAM, TeraDesk + Geneva seems to be the most efficient (in fact the only efficient) multitasking environment. TeraDesk 1.40A (the last one) is less then 100KB in size, and it is quite usable. No fancy makeup, but performs all basic functions, with appearance similar to that of the TOS2.06 desktop. It is a pity it did not see just a couple of revisions more- I dislike the somewhat nonstandard keyboard shortcuts (and the inability to reassign them), the missing Search and Format operations from the File menu, and the somewhat untidy look of some dialogs (this can be corrected with a RSC editor).

I had the same thing happen to me. No power or nothing to the Link 2. I too thought it was the DMA port, but as it turned out, it was the SCSI cable. The guy that made me the cable said some of the contacts were not aligned correctly. I would check on that first. Since then, things have been great.

On the subject of the CT60:

a) Is it possible to fit one to a Falcon with a
PowerUp2 module?

b) What did the PowerUp2 module do (otherthan
providing a 32MHz CPU)? There is an extra light near
the function keys and an AUTO folder patch program to
run but what else came with it?

c) What is the file MAGTOROM.PRG? Is it to do with
PowerUp/Magic or something else?

I purchased this recently from Kevin Dermott with the
aim of recasing and adding a CT60 and AGP card, any
hints to suitable sites would be much appreciated!

If those drivers are enough to enable the card to work with normal VDI
calls, it should work with NVDI.
That would be the same thing as running a mach64 NOVA or an Eclipse
card with NVDI, and it ought to work in the same way (removing the
NVDI screen device drivers and then letting NVDI run after the card's
own drivers/VDI at bootup).

That's fine, I bought a 'Switch Box' and that did the trick. It has a
little slider one end marked 'TV' and the other 'Game'

I've been around CSAST about 10 years and that guy has been here since
then.....
Several years ago had me so ticked one time I was going to a Mac show
just to find him. Except for the space he takes up, he is quite
amusing in his ignorance. Guess i'm getting to old to care.
What a life (or lack there of:)

Mike

Could be the memory upgrade too! AFAIK, upgrades which work are like 1M,
or 2M or 4M... 2.5M is a bit of a strange config!! Can ST-FMs take that?
Don't know!

If the machine was a Mega ST, I would have said "switch off the
Blitter"... but it's not that!

Hi Sinclap

Of course we must all agree that this thread does not apply to Sinclap who is universally hated and despised in whatever he thinks or does. All posters are expected to reply to Sinclap in the most offensive manner they can muster, preferably also insulting his parents/relations and god forbid, siblings. If you see him cross the road you are expected to mow him down, if you see him in the street you are expected to assault him or have him arrested for whatever offence you think you can lie best about in court, if you are his doctor you are expected to euthanise him, or at least cause him extreme pain. What more can I add. Sinclap, we hate you.

Johan,

I wonder about this because for a period of time, I owned an AlberTT video card. I do not have any clue what happened to it but I think I ended up selling it. This was a custom card and I ended up finally finding drivers from Sven Karlsson. It really irritated me because it would only do 1024x768x256 or something like that or maybe even higher. I just know it was extremely unreadable, and it did NOT work with MagiC. No amount of Coaxing would get it to work with NVDI and/or MagiC. I kind of wish I still had the card for experimentations sake if anything else.

Neil,

as far as I know the PowerUp2 was simply an overclock job, useless after the CT60 arrives, and you'll probably have to remove it for the CT60 to work properly. I know CT2 owners have to fix their systems up including replacing all of the factory chips they might have tossed or whatnot. I could be very wrong here, so I hope someone will chime and in correct me or confirm that I am right.

> c) What is the file MAGTOROM.PRG? Is it to do with

That program just improves up MagiC memory protection. It's for 030+ .. has nothing to do with the powerup specifically.

AFAIK 2.5 Megabyte is a normal commonly used memory size for an STf.
A strange, but existing, configuration used to be 3 MB. I remember that,
when you added 2 MB to a 1 MB ST, 1/2 MB couldn't be used anymore leaving
2.5 MB useable. But someone designed a workaround for that so that 3 MB
was made possible. But 4 MB was easier to install than 3 MB. I guess there
are not many 3 MB ST's around.
I'm not really much of a techie - can anyone confirm my story ?

2.5 is commonly used, but is not standard. At least no my friend STE system
was reporting 4MB, so he wrote small program to modify some registers to
make OS know how much memory he really has.

And most Sysinfo-like programs will report 2.5MB systems ad 4MB.

The cable is simply a straight parallel cable with BUSY and STROBE signals
crossed, that is the same used by ParCP that is a far better software.

yes but the powerup2 is not a busspeeder is it? Its just a 32MHz clock for
the CPU right? I've got something similar in one of my falcons, in mine
the speeder is attached to the expansionport so it has to be removed if I
want to use a ct60 or any other addonboard.

I believe all CPU overclockingthingys will be useless with the ct60 since
the 030 is disabled.

Fredrik.

I'm told N.AES 3.0 is being developed, and so is Thing 1.30. But it's hard
to say when they will be ready and available.
New versions of XaAES are anounced in this newsgroup almost every month.
And with Freemint, Sparemint, and Easymint, things seem to be very much
alive.

From: garthrr@aol.com
Message-ID: <20020131111458.21462.00000044@mb-fi.aol.com>
Source record: 38418

I have noticed that a bass (at least one) through a Countryman DI into the mic input of the Peavey pre seems to sound quite noticably inferior to the same bass plugged into the instrument jack on the front of the unit. Does anyone have a thought as to why this might be? Is the Countryman not a decent DI box? I was really surprised at the difference. Unfortunately in my studio its not convenient to use the 1/4" inst input or I would just do that

Hi,

I have an atari 520STe which i'm looking to sell, it has all the normal ports, is fully working. It also has 2 ports that I think may be extensions, added by a previous owner, seeing as I can't see them on any diagrams i've looked up. They are, 2 speaker plugs (left and right) at the back, directly under the power switch, anyways what im wondering, is how much is this system worth?? I got it originally for ?4, but i'd want a reasonablish amount of profit in order to sell, otherwise I'll just keep it and make use of it. I also have a few programs such as 1st Word Plus that would be bundled with it (I only have the backup of this, the original disk was destroyed) and a few file transfer programs and utilitys, and a programming language, GBASIC I think.

Those 2 ports are standard on an STe. I bought an STe and 2 mono monitors for about ?10 which was a steal in my opinion. Depending on the software bundled with it, the price can varie from ?10 - ?50.

Joshua.

The PowerUp 2 isn't really a speeder like the Nemesis and such. It
only takes from the 32Mhz Falcon clock and by-passes the divider in
the COMBEL allowing the CPU to operate at 32Mhz. So it acts like a
switch. It it activated with a PRG, and state was set off some pins of
the keyboard processor.
It does work very well for what it was designed for. Before the
Nemesis arrived, I drove my Mighty Sonic at 48Mhz with it's own clock,
and kept 16Mhz bus speed. I don't know what is inside, but the design
elimated DMA problems on a few of my tempermental Falcons.

I have the same exact problem on my "real Atari" Falcon. It seems to boot up just fine, but once the taskmanager appears, I can't open any menus or activate anything with the mouse, although the pointer moves as normal.

030 specific speeders like PowerUp2, yes. However, wouldn't bus overclocking (like Nemesis) help with overall system throughput, allowing ct60 to be more effective? I don't know this for sure, so please correct me if I'm wrong...

782. First Beta Release of EmuTOS

Newsgroup: comp.sys.atari.st
Date: 2002-01-31 20:36:51 UTC
From: root <doeringm@gmx.de>
Message-ID: <3C59AAE3.E555F201@gmx.de>
Source record: 38435

Dear Atari Community!

We are happy to announce the first beta release of EmuTOS.

INTRODUCTION

EmuTOS is a singleuser singletasking operating system for the 32 bit Atari
computer emulators. It is thought as a replacement for the TOS-images you
usually need today for using emulators and it is also running on some real
hardware, like the Atari Mega STE. All is open and maybe it is also running
on totally new machines in the future.

EmuTOS is beeing developed for more than a year now and is licensed under
the OpenSource Gnu General Public Licence (GPL).

DESCRIPTION

EmuTOS is basically made up of four parts:

- The BIOS, which is the basic input output system
- The XBIOS, which provides the interface to the hardware
- The BDOS, which are the high level OS routines, what you know as GEMDOS
- The shell command.prg we use, as long we have no GEM

The BIOS and XBIOS code is our own developement. It is really written from
scratch and implements nearly all of the TOS 1.0 BIOS functionality, and a
bit more, like e.g. harddisk access and STE sampled sound. A few things
like printing, midi and serial stuff is missing for now, but may be
implemented somewhere in the future.

The GEMDOS part is based on Digital Research's GEMDOS sources, which were
made available under GPL licence in 1999 by Caldera. None of the graphical
parts like VDI and AES are implemented. Instead we plan to use fVDI and an
extra AES, like XaAES (just on MiNT) which together with a desktop make
the GEM you all know and love.

Since EmuTOS just implements the TOS's functionality, you might want to use MiNT on it in order to run more modern software. EmuTOS is not an alternative to MiNT. But EmuTOS is the only free base OS to boot MiNT.

EMULATION AND FUTURE PLATFORM

EmuTOS and MiNT cooperate well. For the future we plan, that both can make
use of a yet to implement standard native call interface for emulators. When running EmuTOS in an emulator, this interface will provide access to
use the power of the underlying OS kernel. It may allow using modern 3D graphics cards, will provide fast native filesystem access and will enable
you to use networking with all bells and wistles - and many things more you always dreamed of.

This is, what EmuTOS is made for: A free OS, that can evolve. Progress has
been fast up to now, because we have a small, but enthusiastic development
team and are eager to see EmuTOS running with GEM and all.

HARDWARE

Making EmuTOS running natively on a new hardware platform is more or less
just a question of driver support for EmuTOS. The same for MiNT, if you'd
like to have it running over EmuTOS.

This is the currently supported Hardware:

- CPU support for m68000, m68010, m68020, m68030, m68040
- FPU detected
- Memory controller (both ST and Falcon)
- Monitor type detection (mono or not)
- WD 1772 Floppy disk controller (write track not tested)
- DMA controller
- MFP
- PSG
- ST shifter
- STE shifter (partitially)
- ACIAs, IKBD protocol (mouse not tested)
- MegaST Real-Time Clock (set clock not tested)
- NVRAM (including RTC)
- DMA sound

AVAILABILITY

EmuTOS has its home at sourceforge:

http://sourceforge.net/projects/emutos

A ready made EmuTOS image or the source can be downloaded from:

http://sourceforge.net/project/showfiles.php?group_id=36560

It is always available in source form from our CVS server at:

http://sourceforge.net/cvs/?group_id=36560

If you are just curious or would like to help us develop this nice
little
OS, you are invited to subscribe to our Mailinglist for developers at:

http://sourceforge.net/mail/?group_id=36560

Hope, you like EmuTOS. If you have any suggestions or comments, we
always
like to hear the good and also the bad things about it.

Your EmuTOS development team.

No problems on my Falcon. I've tried both with and without the new "open taskmanager" option in xaaes.cnf. In both situations my mouse works fine.

Right.
So it is not an emulator thingy.

Remove the line containing 'open taskmanager' from the xaaes.cnf file.
It is not something essential.

Tell me if this makes a difference.

Could you both send me a list of the programs that are started at bootup?
Including accessories. This is basically the list as it appeared in the
taskmanager.

Thanks.

Hello again,

I tried another HD (Seagate ST32550W) but unfortunately I received the
same error:

No ICD host adapter -Caching disabled!

Anyway, the drive is connected to an external SCSI tower with 50-pin
Centronics connectors and built-in PSU (the fan works!).

Here's the specs for the drive:

<http://www.seagate.com/support/disc/scsi/st32550w.html>

BTW, sorry for posting to this forum. In the future I will post
questions of this manner to comp.sys.atari.st-tech.

Thanks again!

Bus overclocking will sure help always, while CPU overclocking will
still help for programs that are not 060 compatible.

Exuse me, but I haven't yet seen an emulator of Atari computer that would be
better than original. It is said that some ZX Spectrum emulators are better
than originals but I'm not expert on that field.

I've been using virtually any emulator that were avialible around (on PC)
and every one of them have some shortcomings when comparing to real machine.

Most programs that uses instructin that are not implemented in 060 can run
on it thanks to software emulation (060 has a special "unimplemented
instruction" interrupt)
I would say "all programs" but I'm not 100% sure.

The original German document was translated into English by DDP
Translation's Peter West, under the name "From 2 1/2 make 3". I modified an
ST accordingly, but found that there were "sparkling" pixels on the screen.
The result of using insufficiently fast chips in the design or something.

The doc isn't available for download AFAIK.

Some of them work better (I.e. maybe MAME). But I dont think there are ANY emu's for 16bit atari's that work better than the real thing.

I hope everyone appreciates the work I had to go through to be able
to post
this message. I haven't had real news access for months. Anyway...

I think alot of people here are completely missing the point of Aranym.

It's not an emulator so that you can run a copy of some abandonware game for
1989!

It's nothing more and nothing less than an attempt to take all of us who are
interested the same route that many companies have gone before. That is
quite simply the goal of divorcing our OS from our Hardware.

How many people in here have bemoaned the fact that they want a faster
machine to
run their Atari software?

How many people in here have complained that they can't go to the local
store and buy
new hardware?

How many people have gone the route of Magic(PC/Mac) only to be irritated by
the lack
of support for resources available on the machine?

Be divorced themselves from their fledgling hardware, you don't see many Be
users complaining about their old 68040 box. Why? Because they upgraded to
modern
major market PC motherboards with fast processors, gobs of RAM etc.

Amiga is going this route themselves. The new version of the Amiga OS doesn't need
Amiga Hardware. You install in on your PC and away you go. No more tracking down
that one reseller of parts and equipment that has a shop 6 hours away.

If you object to the fact that Aranym emulates the 68040 CPU, I have 2 things to say.

1. It is my understanding that in the long term, the ability to run native code will be possible. ie running an atari app recompiled to run natively on the x86 architecture.

2. This is a standard route if you want to run your current software. Even apple went this route. When they went PowerPC they had to emulate the 680x0 in order to have their user base be able to run their software. This CPU emulation is still part of the system.

So why is it, that a major market trend for small platforms is a strategic plan for them
and just another f*#!*ing emulator for us?

Who cares about Thinking Diffe<snip to satisfy legal jihads>nt <bleh> Just f*#!*ing THINK!

From a few conversations with developers on the Aranym team, I think I can state
that the goal is to be able to install Aranym on a box without any other OS on the system. So it's not emulating Atari under Windows or Mac. It's emulating atari on itself.

But is it Emulating Atari?

EmuTOS -> open source modern TOS replacement (no more patched buggy TOS)
Aranym -> Maps system resources to OS. Open source free.
Fvdi -> open modern free VDI replacement
FreeMiNT ->open modern free OS
XaAES -> open source modern free AES
....

Or maybe I'm just f*!#*ing stupid and can't see the trend here.

Well, I don't know about you, but to me hardware is the *most* important thing. If we 'divorce' the OS from the hardware, to me it just isn't real anymore. Honestly, I'd rather pay 5 grand for a new TOS clone rather than installing a free emulator on my PC. Again, it's just me. The rest of yous might think different.

Joshua.

Forget it! Any defense of original Ataris (which was new and fresh,
always when they came out: VCS, XL series, ST series, Lynx, Falcon,Jag)
over emulators or quazi compatibles will result in bashing and responses
startting with "fu****" and other consored words.. We are wrong (we as
atari fans, whi didnt escape to PC and we still kinda love our machines,
even with theirs big flaws, simply cause they are originals, not copies or
pale imitations..) and others are right! No use to piss against the wind,
old Slovenian saying say..

SWE

P.S. PPL pays BIG bucks for let say RR cars, altought almost all modern
cars are FASTER, NICER, MORE MODERN bla,bla.. Tradition IS a factor as
well.

Yes it's not a real Atari. But it is a real ARAnyM box.

And if ARAnyM can run all the software I normally run, then what does it really
matter if it wasn't made by Atari in 1992. It can run CAB, it can run Highwire,
I even read today that it can run Eureka.

> Honestly, I'd rather pay 5 grand for a new TOS clone rather than
>installing a free emulator on my PC. Again, it's just me. The rest of yous
>might think different.
>

I don't understand why ARAnyM is an emulator for you, but a clone that would use
a Coldfire CPU is not an emulator. Both in effect have to emulate the CPU.
It's even possible for the XTOS group to save alot of time and effort by
using ARAnyM.

Basically anyone emulating the CPU would be classified as an emulator if you want
to argue that route. Which means the Hades is as good as it gets or maybe the Milan
060. The CT060 looks nice, but it has been doing that for a few years now. Looking
nice on paper, in snapshots of the board etc. Hopefully it comes out, but even if/when it
does, that still only 100 upgraded Falcons. How many Milan 060's are there?
How many Hades? I'll be generous and say maybe you are looking at 1000
machines total. And I think that's being very generous. What kind of a
market is 1000 machines?
That's not as large by 1/10th as the official Atari manufactured Falcon
market. You can see what a big commercial success that has been.

Don't get me wrong. I have a TT, a few Falcons and alot of other misc
ataris. But $5000 clones aren't going to reinvigorate the market. Too few
people can afford them.
Atari Corp couldn't even get TT's to catch on when they were released as the
atari market thought they were too expensive. I know this for a fact. My
wife was an 'official' atari dealer at the time and I was an 'official'
atari developer. The sad fact was that they were expensive at the time

compared to the 030 mac.

Someone that left the atari market 3 or 4 years ago isn't going to spend the price of 2-3 brand name PC boxes for one slower Atari clone. You might find a couple, but there isn't going to be a line beating the dealers doors down.

However everyone I've talked to that hasn't had an atari for 4 years or more are very interested in the idea of Aranym! Yes I haven't talked to alot of people about it. Just a few, but they all want to see it work on their Intel/AMD box. Why? They don't miss the old slow hardware. They miss the software, the 'feel' of the atari desktop. They miss
the community and the fun. I can't speak for the situation in Europe, but in the US. New
PC's have come down in cost so much that if you upgrade a machine after 3 years, your old machine is worth litle to nothing. Atari Hardware is a strange annomaly. I could probably get a bit of money for my TT with Nova card etc, but a PC from that period is worth next to nothing. Too old too slow. PII 300 can be picked up used for ~$50 at a major store in Columbus, OH. How is a $5000 clone that is just as compatible or not as compatible going to compete for a $50 clone?

And if you object to the non Motorola CPU, compile it for the PowerPC. There is no reason that ARAnyM can't run on the PPC. It just needs a developer to step in and
do the compiling.

If you want to start arguing what is a 'real' atari. You are going to find alot of people arguing different points. Some people are firmly of the quite realistic opinion, if it wasn't made by Atari then it's not an Atari. Others are of the opinion of it was licensed by Atari then it's an Atari (Hades, CLab, Milan). Some are arguing now if it's not a 680x0 it's not an Atari (CT060 over Coldfire). In the end people will use what they can afford and what does what they want to do. If ARAnyM can make that possible for more people then why complain.

Quite frankly I'm really excited about the project. I haven't ran it on anything and I haven't even looked at the code. I know it's early days for the project, but I seriously think it's one of the most exciting things that's happened to us for awhile. If nothing else it's going to give the developer base the potential for machines that can compile large projects quickly without costing several months wages.

Swe I didn't bash you over your love of atari hardware. If you read the
other post I sent you will see I have your point of view in there.

In most ways I agree with you. Atari Hardware is something that was made
by Atari Corp. I have never sold any of my personal atari gear. I have it
all floating around my house, right back to the original Atari 400.
Actually I have my original Pong game floating around as well, but I'm
limiting myself to computers here.

What I objected to and will object to most strongly is the idea that
ARAnyM is just another crap emulator. That's like saying the Jaguar is just
a souped up 2600.
Most of the emulators are crap. I've had a few that I've run for the heck
of it. If you want to play a game from 1985 and don't have an ST anymore I
guess they are ok.
But they aren't realistically a platform. They are an emulated platform for
playing games.

ARAnyM is a way to run our 'Atari' programs on other hardware without having to worry about some bloated other system in the way of our desktop and the CPU.
So you can say it's not an Atari. It just happens to be a completely new platform that is free of any set hardware architecture, which just happens to run Atari applications.
The side bonus is that software developed for ARAnyM can run on 'real' Atari hardware.
I don't see what is to complain about with that situation.

>Don't know!

Yes they can! It was quite a common upgrade in the days when RAM
cost a lot of money. Bank 0 remained the built-in 512kB and bank 1
became the added RAM. My first STFM upgrade had that - then SIM
prices dropped and I went up to 4MB.

For the record, there was even the possibiity of 3MB with the
help of a simple circuit described in /ST Computer/, which I
translated many years ago, using both banks of the 1MB built-in
RAM of 1040s. I even bought the parts for it and had a PCB
layout, but then upgraded to 4MB instead.

Regards, /Peter/

Hi Henk,

> Right.
> So it is not an emulator thingy.

No, i know! :-) But it is fun to try such things! :-)
...and i have good news...! It works! :-)
With the help of an other atari freak i reconfigured the xaaes.cnf and now it runs.
Not really fast, not really secure, but it is working!!! :-)

Now i check arount with different mint versions. It works with the newest kernel in minimal configuration. Maybe with the old kernel, delivered with the stemulator, too.

Do you agree, if ii¿½ll make a zip of the hole configuration, for other stemulator-users downloadable on my web page?
Maybe as a mint/xaaes distribution for stemulator users?

Thanks for your answer!

I'm not actively involved with this project myself. I've got enough with
my normal projects and participating in the Highwire group. I'm just a big
supporter of the project
and can't wait to see it reach maturity.

Here are some of the developers that are involved:

Ctirad Fertr
Milan Jurik
Stanislav Opichal
Petr Stehlik

Patrice Mandin
Francois LE COAT
Olivier Landemarre
Rodolphe Pineau
Antonin Kral

Johan Klockars
Martin Doering

I think there are at least a few names in there that people should
recognize.

I have tried it, and it's indeed very impressive. I've only tried the
Windows-version, which I'm told is a bit limited (e.g. no fullscreen
mode), but for a while it was just like using my Falcon/Afterburner. And
this was on a low-end PC (500MHz PIII w. 128Mb). I'm looking forward to
the point where Aranym is almost self-contained, I really can't see the
difference between my Milan (a non-Atari computer with a motherboard
that looks like a PC, and just happens to run TOS) and a PC running
Aranym, except that Aranym on a 2GHz PC probably will be faster.

I believe I still might have my Nemesis manual. I'll have to dig
through my "extra Atari stuff" boxes to know for sure though.

If I do find it, I could scan it and make it available on my web site
- unless that would violate copyright laws with Titan?

Let me know if it's needed.

This is about how I feel about it too. So far I've not seen one for the
mac I'd call useable, magicmac included. Simple crashes seem to bring
down the entire macos, not to mention it forces me to use magic.
If I can pick and choose, my AES, VDI, tasking kernal, that would be
awesome actually.

Absolutely.

>It sounds to me like there could be a problem in the Link itself.
>Isn't there an LED in the Link that lights up when it is getting power?

Only on the LinkII. On mine, the LED forms the dot in the I of ICD.

I wouldn't mind betting that the OP's problem with garbled directory names
on floppy disks is connected with this problem. I'd try unplugging the Link
from the rear of the ST and trying again. Then move on to sorting out
Termpwr, which is most likely a mis-configured jumper on the drive. It must
be set to "provide TERMPWR to external bus".

>that was a small bug-fix in the iconify-handler. The last change
>before that again was in early february 2000, two years ago. This is
>the 6.20 MagiC-update available from ASH's website.

My MagiC 6.20 update is dated 05.05.2001....
Andreas Kromke finalized and made it available on 04.08.2001, ASH released
it on 29.08.2001.
You're probably referring to the history.txt of the beta version which
stops at 2.10.2000, it's not because the history file wasn't updated, that
the development of the program stopped aswell...

Cheers from Belgium
Dennis

821. More ST spares and software

Newsgroup: comp.sys.atari.st
Date: 2002-02-02 15:26:22 UTC
From: Lyndon Amsdon <bindon@madasafish.com>
Message-ID: <3c5bf718378a00@madasafish.com>
Source record: 38378

Hi

Still clearing space, hopefully someone will be interested in these, don't really want to throw them out. Anyway, I have about 3 internal keyboards, would work fine on ST, STFM, and even Falcon, although, they're the normal grey colour as opposed to the dark grey on the Falcon. I have some spare chips as well if you need one, custom ones too. I think a ST PSU as well.

Software I have (boxed)

Stereo Master with sampling cartridge
Prodata
Fleet Street Publisher
Quartet
Harlekin 2
Superbase Personnal

Unboxed 1st Word, with a copy of original disk, not sure where the original went. However, the manual is there, big fat manual :)

Various Games - commercial, no boxes except Cannon Fodder, I'll make a list, all original disks. I got rid of boxes as they took up too much space!

Kings Quest, I, II, III, and IV!! Full Set! These are boxed, good condition.

Jag games - Bubsy, Chequered Flag, Club drive, Missile Command 3D, Hoverstrike cart, Hoverstrike CD. Excellent condition, all boxes, overlays. The boxs have no white scruffed edges!

Please email with your offers. I would be willing to trade those jag games for other jag games actually, Atari Karts, Themepark, whatever.

822. Using 1040STF's Floppy from 520STM?

Newsgroup: comp.sys.atari.st
Date: 2002-02-02 19:57:54 UTC
From: Krystian Sergiejew <kriss@alphavibes.com>
Message-ID: <6xX68.41$S7.2578@typhoon2.jacksonville.attbi.net>
Source record: 38374

I have 1040STF and 520STM that I have purchased very recently for my vintage computer collection. I would like to play with these a little, but the problem is that I cannot hookup the 1040 because I don't have the monitor that would work with it. On the other hand, I have a perfectly working 520 on a TV set, but I don't have a floppy drive for it.

I was wondering if I could turn on both computers and connect them with standard floppy cable to be able to use 1040's floppy on 520? Is this doable, or am I at risk on damaging something?

Thanks,

Krystian

PS. If anybody has a SF314 for sale, I would gladly buy one if the price is right.

I find it very hard to believe that a professional programmer like AK did
not update his documentation for over a year, so if any changes were
made at all since his last entry in the log, it must be very, very minor
things.

Personally, I don't think we will see another release of MagiC. I wish I
was wrong, but I think I'm right...

All that Dennis says rings true to me. At the time I heard of it KAOSDESK was an alternative to Neodesk - in fact I'm not sure which one came first.

You'll also find several references to features introduced by KAOS in the Magic docs.

> falcon and the st line of computers so I have no idea what I am
> using.

At the desktop, go to the very first (top left) menu and click the first menu entry. If it refers to Atari then it's the TOS desktop. It might say Neodesk\MagxDesk\Jinnee\Ease or something else if you have an alternative desktop. It sounds like you have the straight Atari desktop.

> The folders don't let me go any level it says "UL" with two dots
> over the U.

Ok. It does sound like you've got corruption on the disk, so Cleanup or Diamond Edge might be only way of getting rid of these corrupted entries.

Make sure you copy every file and folder you can to another partition before cleaning the files away. The cleanup process may have some unexpected effects on the good files (there may be bad files that have got cross-linked with good ones). This copying process may reveal further problems you didn't already realise.

Hope that helps.

Source record: 38382

I have a ACER 17" svga monitor on my falcon, and it is starting to give me too mucg green, and it looks like the convergence is going.
the effect is a lot of fuzzy greenish text.
is there anything I can do that could fix this? or is it on its last legs?

also, I gave a mac radius monitor
64.79 KHz, and 71 Hz
it is an RGB output (although I think it gray scale) and a screw for sync.
could i use this with my falcon?
(the frequencies say no, but it might be worth a try if I stay in one res)

832. Panther ISA adapter question

Newsgroup: comp.sys.atari.st
Date: 2002-02-03 12:41:02 UTC
From: "Simon (PNC)" <pnc@mail.portland.co.uk>
Message-ID: <Cda78.2633$XS6.335424@news2-win.server.ntlworld.com>
Source record: 38384

Hello,

I'm in the process of buying an ST with a Panther board in it. It's currently driving a SVGA card, but I believe it can also drive an ethernet card.

Does anyone know what kind of card I need? What drivers are available?

Thanks

Simon

833. Mega ST2 with TOS 1.02?

Newsgroup: comp.sys.atari.st

From: Dennis van der Burg <d.w.vanderburg@student.tudelft.nl>
Message-ID: <3C5D36BF.BB55EEDD@student.tudelft.nl>
Source record: 38385

Hi,

recently I picked up a Mega ST2 from a second hand shop. When I powered it up, I was amazed to see the TOS 1.02 desktop. I thought the Mega ST always came with TOS 1.04? Does this mean that this Mega ST doesn't have a BLITTER chip (since I cannot turn the blitter on or off in the TOS 1.02 desktop menu)?

I also noticed that this Mega ST has a cooler fan, whereas my other Mega ST (with TOS 1.04) has not got one ... is the fan typical for an early Mega ST?

best regards,
Dennis

TOS 1.02 was written for the Mega ST, and all early models had this TOS. All Megas have blitter chips, though I dont think that you can turn it off in the GUI without using a desk accessory.

AFAIK the only drivers for the Panther ISA-adapters, are the
NE2000-drivers for STiNG and MiNT-Net. I believe these are commercial.

Source record: 38388

Sorry, I think if you cant see anything on the STF's screen then you aint got a chance of successfully setting up a network between the two. I think you are going to have to try and find an external floppy drive for the STM (SF314/ SF354) or get / make a modulator box for the STF.

Btw, there are other compatible external drives around, such as the cumana.

A further question to the one below: I've seen 2 Megas - each with a different nameplate. One says Mega ST, the other ST Mega; both have 2 mb ram and otherwise look the same. Is there a difference other than the obvious name switch?

Yes, that's right!

>Megas have blitter chips, though I dont think that you can turn it off in

Early Mega 2 did come without the blitter chip. I bought mine in late
1987 with English TOS 1.2 as there were no Swedish TOS ready. When I
bought it the dealer clearly stated that he would later put in the
blitter chip without cost.

>the GUI without using a desk accessory.

Without blitter no blitter enable menu entry was present in the desktop.
When I got the blitter chip this entry appeared so I guess this
functionality to sense if a blitter is present is built into TOS.

Afaik all Mega ST have a fan built into the power supply. I also have a
newer Mega 4 (with TOS 1.4) with fan.

From: Michael Livsey <nina.michaelNOSPAM@btinternet.com>
Message-ID: <a3jte4ems1@knossos.btinternet.com>
Source record: 38394

Just thinking pre-emptively here, but is there anyone in the UK who specialises in spares and repairs on the Atari 1040? I've been running my synth set-up on my trusty machine using Cubase since what, 1990? I'm not worried about it yet, but it pays to think ahead. A spare mouse might be needed soon at least. I wonder if my PC will prove as reliable as the Atari has over the years?

By the way, you can hear some of my Atari-sequenced compositions at..

Replacement Atari mice are getting hard to find now unfortunately. There was someone selling some a few months ago. Your best bet maybe to purchase an adapter that will allow you to use cheap PC Serial mice. Chris Crosskey sells these, his email address is available on request (I wont post it because of spambots etc).

Atari-workshop www.atari-workshop.co.uk do repairs on the Atari, and I think they are the only ones in the UK that do it. There used to be TUS in Macclesfield, but I have no idea if he does Atari anymore.

As for reliability, Ataris are the most reliable computer I have ever used.

Barry at Keychange www.keychange.co.uk lists some on his web page.
He also seems to be able to do some repairs and upgrades. At present
STE machines which can easily be upgraded to 4Meg seem to be reasonably
avaiable 2nd hand.

Ugh, I don't think I would say that. Whilst both mine seem to work all right
at present
but there are plenty of posts on here about dead or disabled machines, often
due to the
cheap and nasty PSU failing, or in the case of SM124's the EHT drifting.

And there is also that oft repeated advice, that if it goes intermittant to
try dropping it from a couple of inches to re-seat the chips....

The ST design cuts lots of corners, and does not always resepct the stated
limits

for example for load on the Yamaha Sound chip.

I suspect that one of the most relaible computers I used was the old IBM
4381
mainframe I used to tend, many years ago. It ran 24 hours a day for nearly
five years
with only one or two failures per year, but nice sound , no, nice graphics,
no.. :-)

This is possible with LittleNet, which runs as an accessory via the
MIDI cables. The only minor concern is that it might default to
read-only, so unless you can see the screen to check the 'write
enable' box, it might be a one way solution.

I had a copy of LittleNet until very recently on my hard drive, but I
fear it is now deleted (it conflicts with Geneva, which I use almost
exclusively). Try the Belgian FTP server.

Hello Simon,

Of course it is possible (electricity is electricity). You will have
to make sure you deliver the same voltages, polarities, and minimum
amperages along the same wires as before, so it may not be a simple
plug-in operation. But it is possible.

That only works on VME systems. AFAIK, the original mega didnt have VME but Megabus.

You can either use a Crazy dots or a Panther Chris, the Panther is still available but I think it's in kit form.

I would like to have a show too!

I was thinking, if we all put out heads together on this one, we could get something out of it. Maybe get Myatari involved? There must be some Atarians out there who know of a place we could have it? It doesnt have to be Earls court or anything! A church hall would be good, like what some user groups use.

Or, find a village hall with a bar :)

I'm serious about this though!

Simon

864. UK Atari Show

Newsgroup: comp.sys.atari.st
Date: 2002-02-04 05:26:22 UTC

Message-ID: <5Yo78.5432$vd4.693684@news11-gui.server.ntli.net>
Source record: 38316

It seems quite a few people would like an Atari show in the UK. Since Sharward stopped doing the Stafford show, we have been completely stuck with anything to do.

The main question is, where do we hold it? I was thinking along the lines of Village/church hall kind of thing. Keep it small, and friendly.

A regular show, even once a year, would give Atarians the chance:

To meet fellow Atarians
To exchange ideas, help and tips
The buying and selling of software and hardware that isnt quite so easy to get these days
The chance to try out new and old pieces of software
And, most importantly, the feeling that there is still an Atari scene, even if a little small!

Now, I would dearly love to help in any way I can, but unfortunately I can't help with a location. It would be good if the location was in a place where it is pretty much central to the UK, and easy for people to get to.

I'm sure some of you people can help with this? Atari supporting companies? User groups? Publications? Users?

We need to do this!

Simon

TOS. All
> Megas have blitter chips, though I dont think that you can turn it
off in
> the GUI without using a desk accessory.

There is a "Blitter" option added to the bottom of the "Options"
menu - click it and you will toggle the blitter off/on.

TOS 1.02 also added the Blitmode() XBIOS call to configure the
blitter.

(Based on my experience of owning a Mega 4 bought at the start of
1990 - NZ$4500 for the Mega, and NZ$2000 for a Megafile 60 HDD. I
still have the HDD - although it has been inactive for the last five
years or so)

There may have been a few very early Megas without blitters, or some
with erratic or nonfunctional blitters, which may cause TOS to fail to
detect it, and hence not add the "Blitter" option to the menu.

Sigh. Two revs in 24 hours, not good.

Integrating CAB's cookie functions has caused problems logging into
yahoo.com. Yahoo uses cookies with domain=.yahoo.com and CAB never processes
these.
(At least on my CAB 2.71, CAB ignores any cookie with a leading '.' in the
domain.) So I've had to go back to always using the OVL's cookie management,
as in 1.8602 and earlier. There are some other idiotic bugs I created in
1.8603 as well, so you should throw that away and get 1.8604 instead.

Here's a good place to start, talking about VGA to TV converters:
http://www.hut.fi/Misc/Electronics/circuits/vga2tv/index.html

There's a link from there listing VGA to TV ICs. The ST video is not VGA,
but
perhaps some of these chips can handle the ST resolutions.

Absolutely,

Depending on which machine you want to replace for, the degree of difficulty is varying. I remember going through an absolute total PAIN on my mega ste. I bought the board from toad, with no idea what voltages go to what pins. I don't remember WHAT I did to get them, but supposedly toad had already thrown away all of their tech manuals and atarian employees! I guess that's why I picked up a Mega STe board for so cheap. Anyway, the Falcon is extremely easy and I think the TT isn't so bad. ST could be worse but I don't know.

871. Ethernet Boards

Newsgroup: comp.sys.atari.st
Date: 2002-02-04 08:15:16 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <u5sgnesfmqsu33@corp.supernews.com>
Source record: 38323

Hey guys,

This post addresses two subjects. The first being that I have searched desperately and have found a Genius E3000-II pocket ethernet adapter, the kind that is sold with Elmar Hilgarte's no longer existent package. Much to my amusement, I hear several people have these adapters or can get them but have no romport adapter. Needless to say I will be manufacturing several of these using press-n-peel paper and my etching kit. The electronics are available from mouser for <$1.00 per board. Since I must buy a 30 pack of press-n-peel sheets I have the possibility to manufacture many of these romport adapters. Please email me if you would like one. Ordinarily I would just buy from Elmar, but he has trouble answering his e-mail ;-) It is worth noting that I live in the US whereas elmar is overseas. Also worth noting that I do not have ANY spares of the Genius LAN adapter. This is the _HARD_ part to get ahold of.

My second question is... Is there any diagrams out there ready for printing of Nova card or Panther card. I woud like to manufacture these boards if I can. The Nova only has one or two little chips on there but my roomate who owns the TT claims it's a specialized IC. I haven't peered into it yet. Aside from that, it's just traces that connect VME to ISA bus.

I have never etched anything using press-n-peel sheets yet, so don't count on me yet, but I am curious how much interest there would be for me to produce things that are free for me to produce, and charge minimal cost (supplies).

Thanks
Mark

Hi all !

New version of MyMail (1.54) at my homepage.
http://www2.tripnet.se/~erikhall/programs/mymail.html

New in this version:
- Support for Vacation message.
- Auto forward of mail
- Added logging for POP3 (for debugging)
- Total redesign of the binhex support.
- Editable fields is now configurable and can have 3D style.
- Spam filter files is now not included in the zip files
but can be downloaded separatly from my homepage.
- Please read more in the history and docs regarding
bugfixes, new functions, known bugs, limits and changes.

You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.

If you find any problems with MyMAIL please let me know.

Best Regards
Erik Hall

This data sheet describes a chip that will probably work for the ST.
http://www.rohm.com/products/databook/mm/pdf/ba7230ls.pdf
It is used in VCRs and other consumer video gear to superimpose an on-screen
menu onto a video display. It will take an RGB input that uses
NTSC-compatible timing; i.e., it will handle ST resolutions but not VGA.

Worked straight putting in a PC PSU for my MegaSTE. After few years I changed
it with a TT in the same tower case, adapting it a bit for holes in the back
and used again the PC PSU without wiring or modifications, just plug it in.

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

Do you have a TV with a scart socket (RGB input), if so you can wire the ST to a scart socket. I did this successfuly in 1995 with my philips TV at the time.

Message-ID: <1q2m3a.fnf.ln@127.0.0.1>
Source record: 38332

Hello,

- About SDL:

I just finished a new version of SDL, in which I added an IKBD driver for keyboard and mouse. It should be better than gemdos and bios drivers. I also added timer support via vbl_queue vector.

I sent these latest patches to SDL maintainers, so they should be integrated in a future official release.

If you wonder why I made sources available, it is simple: on one hand, the licence enforces this, and on the other hand, I can stop working on it at anytime, for any reason. So it is better if someone else can continue to work on it.

The other big work to do is audio support for all Atari and clones, which is lesser available than video in system functions. Gonna be a huge fun to do it.

- About Nuq/quake:

Well, with the new SDL drivers, it still works good. Now fullscreen is default (under GEM), and double-buffer too (under XBIOS). Read the doc if you need to disable them.

The benchmark page is also on my web site:
http://www.multimania.com/pmandin/fr/nuqbench.html

I used to have a Nova VME card, there was one chip on it that appeared to be a GAL, other than that it was just a few diodes and resistors and maybe a cap. I'm not sure if the chip was a GAL to be honest. The other thing worth noting is the one I had was for TT only use. Some have jumpers and can be fitted into a MegaSTE.

Hi Mark,

>I have never etched anything using press-n-peel sheets yet, so don't count
>on me yet, but I am curious how much interest there would be for me to
>produce things that are free for me to produce, and charge minimal cost
>(supplies).

Hmm, I doubt press and peel can do the fine pitch of Elmars design (SMD).
If you really want to use press and peel (biggest waste of time IMO)
you'll have to change your design. There is 99% chance NOVA does use some
sort of GALs or similar logic. Unless they were not locked, you have
little chance reverse engineering this. You'd also be breakign copyright
laws. And the Panther is made by http://www.wrsonline.de unless they
stopped stock. Again, is this not copyrighted? You'd be better doing a
modification of the ET4000. I was going to have a go with it on my
Falcon, should move across easy enough. But really, the ET4000 doesn't
have good enough specs against Videl considering the compatibility drop.

its all about atari games, not atari the computer really, they do mention
the ST and falcon but only briefly. Not worth buying imho.

Fredrik.

You maybe able to port Linux to a 1040ST as long as you have a 68020 or
higher CPU replacement. There had been some work on a uclinux
port to the 520ST, but not much has been done with it. The original
author booted STonX. I have tested it with a real 1Meg 520ST and
that also works.

Here is the link:

http://www.esat.kuleuven.ac.be/~pcoene/atari.html

uclinux can be found here:

http://www.uclinux.org/

Of course, debian-68k already works on a TT or Falcon.

Source record: 38252

I'm getting so close!

I set the jumper to "term. power to SCSI bus". The LED on the Link2 is
now lit so I know it's getting power. Also, I no longer get the error:

No ICD host adapter -Caching disabled

The drive is recognized on bootup as:

ID 0 Seagate ST32550N

But when I run the ICD SCSI Hard Disk Installation Program
(INSTALL.PRG) I get the following error:

Install found no hard disks... check all connections on power and
signal cables. Make sure your hard disk starts when power is applied.

Do I need to set a jumper for this as well?
I tried setting "Enable motor start" but this did not help.
I can hear the drive starting and stopping at random.

Any help appreciated!

If IRC, one can use the ST/STE VideoMaster Video player as a TTP.
The Video Player is Free to distribute.
BTW, there are 2 versions of the player. One for the VideoMaster Falcon
(Falcon version) and one for ST/STE VideoMaster.
However finding video/films to view may be a problem. There are some on
various CDs but I haven't seen any on the FTP sites.
Real Shame since the VideoMaster will record the Audio of the Video you are
recording if you want.
The Falcon version is really Cool! With 256 color picture support in the
Video and 16-Bit Stereo Sound support.

I'm rambling on but if someone who knows how to code would take a look at
VideoMaster ST and the Falcon version, I'd bet
one could use them for something like real time video and audio transfer
over the Net and other uses.

In other NEWS, YES I bought a VAIO NoteBook and NO I am not selling my
ATARI's. They are much better than PC's
the problem is that not enough folks are programming for them. REAL SHAME.

It is possible, but no one has done it yet. Regular Linux uses a MMU
for multitasking, ans the 68000 chip has no MMU. (The 68030 chip DOES
have an MMU, which is why Linux works fine on the Falcon and TT.) A
non-MMU version of Linux called uClinux exists, but this has not yet
been ported to the Atari. If the port is ever done, you can expect
the speed to be rather slow.

See http://www.esat.kuleuven.ac.be/~pcoene/atari.html for more
information.

The PMMU is not required for multitasking (remember that MiNT and MagiC
can do multitasking with the 68000) but only for memory management.

Hi All,
Anyone here have a small sized Cubase Stereo AIF ? The ideal would be only one hit of an instrument on the left and a different instrument on the right (Ex: snare on the left and a bell on the right). To be used to test L/R Falcon outputs using Cubase.
Please E-mail it to me (above) if someone has something similer.
Thanks,
John G.

907. YM to MIDI converter

Hi there,

I'm looking for an YM to MIDI converter please.
Where could I find this software?

Thanks

This is a long shot but is there a source where one could acquire an ECM for the ST Book? ECM is the LCD screen Atari used for the ST Book. I'm in the process of getting a functional ST Book with a partly damaged LCD. Thanks.

Joshua.

This doesn't sound good. Check the power connection to the drive to make
sure it is not intermittent.

Otherwise it may be that the drive is not successfully coming up to the
right speed and the controller is attempting to get over this by
starting/stopping.

Lyndon,

Alright I am listening, how did he manufacture his design then? I am kind of new to this so I don't know if he had professional manufacturer do it or what. Why do you think press-n-peel is a big waste of time. Yeah I figured that was a GAL on the Nova, and I realized I would be breaking copyright laws. But I think it's kind of silly for them to be charging $800 for a $40 video card and a $1 IC on a 50 cent board. I can understand everyone needs to make money, but greed definately took it's toll on those prices. And they gave the drivers out for free, so they can't claim that that's where the cost was. If I created a second Nova board, it wouldn't be for anything except my own personal use and it'd never be sold.

Lyndon,

Noticed the chips I can get are LS374N and LS374S, do you know what the difference is? Is that just the packaging and mounting, S being surface mount?

Mark

Mike,

That _should_ be impossible. I looked at the schematics, the wiring scheme
was different. Did I chop up a power supply and resolder wires back down
to the connector in the exact same place I chopped?
I'll surely have to kill myself ;)

My understanding is no. Unless you find someone that has an STBook with
a good screen but bad guts. The screen was made by Epson or Cannon or
someone
as a test and no one else in the planet choose to use them. So basically
they
only exist for the ST Book. If you work out a hardware mod to use some
other
sort of laptop screen in an ST Book you would probably quadruple the number
of working ST Books.

I have a couple of 386 laptop screens kept after the laptop was so rubbish. They're 640*480 AFAIK, black+white. They use same/very similar pinouts and timing. Seeing as you say the old ST Book ones were Canon or similar, almost all old laptops are Japanese. I have a Sanyo and Sharp I think. Data sheets are difficult but I worked out the pins just by inspecting the board and screen. I think they use 8 bits and divide the screen into 2 or something. I haven't tried to interface to my LCD screens, although, something I will do.

If anyone has an ST Book with dead screen, please email me!!

Hi Mark,

>Alright I am listening, how did he manufacture his design then?

Professional PCB makers.

>I am kind
>of new to this so I don't know if he had professional manufacturer do it or
>what. Why do you think press-n-peel is a big waste of time.

Been there done that. It left tracks that were bitty and in tight places
the plastic didn't pull off board. You heat the stuff onto the copper
clad board, pulling it off always made a mess of the design. Fine for designs
where tracks don't run between IC pins.

>Yeah I
>figured that was a GAL on the Nova, and I realized I would be breaking

$800? Where was that!! I'd say that was a rip off, I though Nova was a
complicated board. Maybe I was wrong, ah, this is ISA right? Did they ever
do PCI, PCI is more of a challenge ;)

>Noticed the chips I can get are LS374N and LS374S, do you know what the
>difference is? Is that just the packaging and mounting, S being surface
>mount?

Yes, I guess so. The important parts for TTL is the LS (determines speed
grade, power consumption etc) and the number afterward is the actual chip
function. eg, you could use HCT374 if you want, but better to stick to
what it says. The letter afterward is sometimes just manufacter branding, I
never looked into that.

Its a straight swap with the correct type of PSU.

>Village/church hall kind of thing. Keep it small, and friendly.

I think the problem is not the deprivation from Sharward of Stafford, as this was
an ideal venue for all Atari and Amiga(Cough) sorry. But our family the 68000 club
could join together in a show in Stafford. What do I mean.?

1.Well the venue at Stafford must still have shows all year round of various displays.

2.It is only a question of who or what local computer organisers can book the Bingley Hall.

3.I ask any local Atari owner in Stafford near Beaconside or around 3 site 16mu to be
exact.

4.To tell us of local shows due in the next couple of months, this will allow us time to
make
some form of offer.

5. I note in some of the pc(botcholism) mags of shows called All Format shows around the
country,
does this not cover us as well surely.

I would still plump for Stafford for nostalgic reasons memories of an old flame can still
burn sometimes
kim mu sar be. But the idea is still sound and I would vote yes in a poll for Stafford.

Regards pinning to be let out of this sleep.

Alright, and I don't really feel like redesigning anything, and plus
Elmar emailed me today so perhaps I will purchase several through him.
I would like to get the press-n-peel stuff anyway for production of a
vme card perhaps or something else I like to toy with ;)

The homa systems webpage sold Nova cards for $350 in upwards of $800 I
believe. They were always extremely expensive. I don't know why. my
roomate bought his Mach 64 ISA card for $20 or maybe less. Just that
silly board full of traces and 1 GAL was the expensive part.

Well I might produce one just to say i did. I honestly don't care how
large my board would end up being so perhaps I will design a different
PCB suitable for press-n-peel. Though I wonder if I can pick up those
chips in non SMT packaging. I think I will order them and see how
they arrive, since they are only $1 for all of them.

Hey all,

For those of you who visit regularly, you may have noticed some connectivity problems with atari-source lately. With 48 hits in the last 2 days combined, I know I have. Unfortunately what happened is we accidentally let our domain expire due to an incorrect email address. The root-servers seem to have been reupdated now and queries should execute properly now. I apologize for this and welcome everyone who visited before back again. I should also note, that I hear atari.org should be working again by tomorrow as well.

Thank you,
Sincerely,
Mark Duckworth

Hallvard,

I once upon a time owned what I believe to be an Imagic double sided double density ST external disk drive. This drive had a track indicator similar to what you speak of. I always thought it was the absolute most interesting feature I have ever seen. Unfortunately it seems to have gotten lost in the shuffle of one of my many moves, or perhaps it was broken. I would definately like to know more about this if you find more.

Well, if it is the case, it's a real big problem. I must not be the
only person that is deeply involved with atari.org. But my WEB page
is in trouble with this. I don't still receive E-mails ... It is
a real bad trick for me. I wish it'll be soon resolved. Bad news ...

Sorry, its a bit of a long one this so take a beep breath....

The NEC would be a good location as it fairly central and has good access by both Road and Rail,
Parking and even good access by Air for any potential overseas visitors/traders.
There are two obvious problems with this, the first it that any stand alone Atari event would probably be rather lost in even the smallest hall, the second is the price. Although I don't know what it is it's probably more than those attanding could afford.
One option would be for someone from an atari supporting company (as this would give more credability than just a plain user) to contact the organisers of another event and try to blag a small corner somewhere thus letting the big guns cover the cost, a look at the NEC web site shows several events which might be applicable, these are...

The Spring Fair (Trade)
Electronic Retailing exhibition and
NEPCON

The first two are not practical this year, however NEPCON is is August and so there would still be time to arrange something for this year.

Another thing in favour of the NEC is that its a little closer to people like 16/32 Systems, Atari Workshop and Telegames than Stafford. Speaking of which, before we all get carried away with venues shouldn't someone canvas these and other Atari related outlets to see if they would still be interested in turning up?.

Ok, so the NEC is probably not a realistic option but I just though I would throw it in for consideration.

BTW, I have not noticed this thread on other newsgroups, if we are going to have a show shouldn't the VCS, Jag/Lynx and 8-bitters also be included in this discussion?. If the asnwer is yes then the question becomes how and where?, as you cannot sencibly carry on one thread over several newsgroups simultaniously.
Sadly this hightlights the self destructive, fragmentary nature of an already small community, perhaps we should look at trying to de-fragment ourselves a little before doing anything else, then there might be enough potential vistors going to a trade show to make one worth while.

I have unused Mega STE kbrds price each is £25 sterling plus post.

They have various language keycaps, (Spanish, German etc.) but take the
machines' TOS language.

I will sell the PCB/keys on its own for £10 sterling plus post, the cable
for £5 sterling plus post.

We managed to attach a 640*480 b/w PC LCD to a STBook - the problem ist, the displays are split in two halves, so you have 200 lines at the top, then 40 lines of garbage (mirrored from some other area of the display), then the bottom 200 lines of the ST display, then again 40 lines of garbage.

Worked fine to verify that the 4MB STBook was working, but is not useable for real work.

Hello.

I recently acquired a SoundStreamer cartridge port expander.

It's marked Composers Desktop Project and Atari ST Cartridge Port Expander.

It's cream and brown, about the same size as a Midex without the midiout
ports branch
and has 3 cartridge ports named SoundSTreamer, port 1 and port 2.

It has a select switch for the ports.

Anyone know anything about it?

I also acquired a Cubeat dongle with no software/manual.
I've never seen Cubeat so if anyone knows where I can download it from
please post.

Barrie at Keychange Music.

> find any consistent pattern and thus a complete understanding of the
> above other than they both have something to do with which location to
> look for files or something. I'm not sure.
> Anyone care to fill me in?

Default dir is the directory where the application will look for files.
Parameter defines the way the filename of the work file (azerty.zip for ex.)
is transmitted to the application : file path only sends the name of the file
Possible configs:
Application & Full path (1)
Top window & file name (2)
Application & file name (3)
Top window and full path (4)

Let's take an example with stzip.prg in C:\STZIP and x.ZIP in C:\
Double click on X.ZIP in top window C:\

confg (1):
stzip's default dir is C:\STZIP, but it receives C:\X.ZIP as a parameter
so it has no problem finding the file.

config (2):
stzip's default dir is C:\ which is the directory of the top window
and it receives X.ZIP as a parameter : no problem since it is in C:\.

config (3):
stzip's default dir is C:\STZIP, and it receives X.ZIP as a parameter
so it will not the file because it is not in C:\STZIP.

config (4)
stzip's default dir is C:\ which is the directory of the top window
and it receives C:\X.ZIP as a parameter : no problem

IIRC setting default dir to "top window" causes problems with
applications which have .RSC, or config files.

So I think the only really useable setup is "Application & full path"

> Also, when installing a program, these settings appear as default (which
> can of course be changed for that program).
> Can anyone confirm this?

I think that's right

Hi,

Still looking for an Atari Falcon stock system as follows:

4MB or more preferably...
MultiTOS (if possible)
80MB Internal HD or ++
Comes with SC1224 or better color monitor _or_ VGA monitor adaptor.
Any extras a plus.

Please contact me at jagcube@prodigy.net send pics if you can! =)

Thanks,

Clint Thompson
http://jagcube.atari.org

I have tried this with TOS 3.06 (it is almost the same as 2.06... ;-))
and it *does* work perfectly.
You have to set "Default dir: Top window" (so the doubleclicked ZIP
file will be extracted to the folder where the EXAMPLE.ZIP archive
is located). When you set it to Application, it will be extracted
into the folder where ZIPJR.TTP is located.
You must set "Parameter: Full path", because otherwise ZIPJR.TTP
will not find the EXAMPLE.ZIP file.
In "Arguments" you set -xrg (with one space at the end, it is essential)
and "Document type" is ZIP.
I have checked this with TOS 3.06, but I couldn't check it with
2.06 since I don't have it ;-(
If it does not work with 2.06 than it must be a bug in this version
of TOS.
If it does work, than it is a perfect example of an installed
TTP program ;-)

BTW. I may send you a simple PRG that will display the command line
(parameters) that are passed to it, so that you will be able to play
around with these, seeing exactly what is passed to the application.

Hi,

Ken Seumas a ï¿œcrit:

> I have a 19" moniterm monitor, previously used for a megaST,
> will it work on a TT or Falcon?

Definitely not. I tried it, and got a completely screwed display. I then asked the same question as yours on the French newsgroup, and a guy from OXO Systems answered me that the two monitors were different and that in the worst case scenario trying the Mega ST monitor on the TT could break the graphics controller.
As for the Falcon, I don't know but I doubt it very much.

No, that shouldn't make any difference. But the fact that is goes at 7200
means it is fairly new so my next hint of putting a drop of light oil on the
lower HD bearing ceases to be relevant.

Remove the data cable from the HD and listen when it powers up. It should
get up to speed then do its Power On Self Test (a bit of head chattering)
then go quiet. If this doesn't happen then the prob. is somewhere in the
data cable or the driver you are using.

:) I remember the original cost well.... And people wonder why you
want so much for a re-sell:)
The required version of the Mach 64 card is inexpensive now, but takes
a while to find one. Not impossible. There's a GAL on the card, not
likely locked, it isn't that type AIRC. One could make a NOVA adapter
just by bread boarding...Gehard use to have some adapters in stock,
cheap, surely beats spending many hours of your own time. I doubt you
would be breaking any copy right laws reading anything within the GAL,
it's likely just some bus logic right out of the manual. The software
drivers have been hacked several times for the Afterburner and other
applications and no one seemed to mind then, why would they now? Once
you go NOVA on a Falcon, you won't go back:) Maybe the Eclipse is a
better performer, I don't know it's actual availability.

I just bought a SCSI-PC card reader from Kodak online stores
(www.kodak.com) for $30.00. I don't have any cards to test it out with
yet. Just seemed like to good of a deal to pass on.
Are there BSD drivers for ethernet SCSI? Think a PC card to ethernet
adapter would work?

947. New game in automn

Newsgroup: comp.sys.atari.st
Date: 2002-02-06 19:42:21 UTC
From: yves.rogne@free.fr
Message-ID: <3c61871c$0$4614$626a54ce@news.free.fr>
Source record: 38198

Hello everybody,

We're making an adventure game. We're making it with a F30 and an Had�s but
would like to know if it is possible to make it compatible with ST.
But for that we need your opinion dear Atari users !

The game will have an heavy graphic part : minimal 100 Mo. So we're planning to
put it on a CD, but... is it possible to connect a CDrom with a ST ?
I think that with a Link xx cable and a SCSI CDrom it may work, but I'm not
sure.

Does all ST owners have a monochrome monitor ?
It would be less work for us to make a monochrome version for ST users, but if
you're many that only have a color monitor, we will do something for you.
How many would prefer a 640x200x4 instead of a 320x200x16 colors ?

How many TT users would like to use the 320x480x256 colors (TTlow) and how many
would prefer the wonderfull 320x480x256 grey mode ?
Hom many for 640x480x16 ?

As we have a good musician, no CDrom would mean no sound, sorry.

The game will be freeware : you'll just pay the postage + 2 Euros for the
CDr itself and we will send the CD werever you will be. If you send 2 inter-
-national reply coupons, you wont need the postage fee.

Questions ? Suggestions ? Advices ? Write to us --> jeu.tos@free.fr (THIS EMAIL
WILL START AT 7 f�buary noon, not before please).

Regards

If a drive does not spin up cleanly it is usually a drive fault.

Yes, but SCSI only.

> : 7) How many Falcon-based games and Falcon-based 'graphic' demos are

us
> : the name of the FTP site that might have ST/Falcon "cool" graphics
demos)

Probably about 10 commercial Falcon games, lots and lots of shareware and
demos etc

Best starting place: www.dhs.nu

> : 8) Are ST games compatible with the Falcon? If so, what percentage?
If
> : not, why not? (knowing that will allow me to decide to order MegaST4 as
the
> : high-end ST system rather than Falcon).

Some can run no problem, most need the use of an program called Backwards

> : 10) What is the standard graphics mode (color bit planes as well) for
the
> : Falcon?

Standard GEM is 320x200x16color. The Falc can do higher resolutions upto
24bit color, but you loose pixels the more colours you get, unless you use a
screen expander like Videlity for example (I may be wrong here)

Well, I take my previous post back. It can't work on the Falcon, but
the TT is perhaps possible. I had forgotten the TT has ECL circuitry.
Anyone ever try it?

Galen

> I can hear the drive starting and stopping at random.
>
The drive should not be stopping. I suspect a bad power supply or a
bad motor. Put a voltimeter across your 5V line and see if it
fluctuates. If it does, it's probably the power supply. If not, the
drive is terminally ill.

thanks for the replies!
I remembered trying it on my falcon a few years ago.
blew the video.
very expensive mistake!!
I am more cautious now, I ask here first!! :-)
but I wondered about the TT because the hi-res mono monitor for that beast is ECL also.
thanks for the feedback!

all three ST resolutions plus
mono (2^1)
4 colour (2^2)
16 colour (2^4)
256 colour (2^8)
32,000 colur (2^15)
65,000 colour (2^16)
resolution up to approx 800x600
unless you have Blow-up hard, videlity, or some other resolution expander or speeder.
hope this helps your quest

Virtual memory, virtual address spaces and memory protection all require
a PMMU. Unix/Linux make heavy use of these features and in particular
memory protection and virtual address spaces are an inherent, important
features of these operating systems.

Mike,

That is an interesting proposition that I have not yet thought of. I know Lonny's Hades has 4 PC card slots in it, so if anyone could tell you anything about them, he could. HD Driver seems to support the CF cards really well as they are "standard IDE controllers" or whatnot (at least that's what it says in M$ boxes). I wonder though if it would use SCSI <-> ethernet or SCSI <-> PC card <-> ethernet drivers. I'd think once you had the appropriate scsi to pc card driver built, it'd be a simple matter of porting a bsd/linux driver for the same PCMCIA device. An interesting prospect....

As for the Nova, if anyone undertakes this project, I would seriously like to have one for my Mega STe. Unfortunately, I can't really disassemble the board I have and desolder everything off of it as it isn't mine. I would think the easiest procedure would be to desolder all components, scan the board, touch it up and then you could produce your own with print-n-peel or whatever else you had in mind. Then each of your atari's can have their own Nova ;)

Lonny,

I was actually one person working on something. If you look under my personal notes in the articles section of atari-source, I have reasons of why I gave up the project. It's important to note though, for those that do not feel like visiting the site, I will give away this Asante EN/SC adapter to anyone else who is willing to try, with free shipping. I can't even get it to return a SCSI ID and according to asante it must be addressed at 1.5Mbps. I.E. my powerbook with an 040 has too fast of a scsi bus to use it and it crashes it.... Pretty bad if the adapter doesn't work on it's native environment, how are we supposed to hope to write a driver for it!?

Hi Galen,

>... is it possible to connect a CDrom with a ST ?
Yes.

Great, so the game will be definately not spread on ZPI disquettes, only CD.

> Does all ST owners have a monochrome monitor ?
No. However, you could verify that it runs under Sebra, the freeware
monochrome emulator for STs.

Well we want a fast game that we make a sp cial release for each kind of screen
and that it is so big.

> How many would prefer a 640x200x4 instead of a 320x200x16 colors ?
It depends on the game. Which is needed more, resolution or colors?
You decide this one.

I always prefer resolution, but anybody had different taste so we would enjoy
that people who like a kind of screen send us an email then we will make
statistics.

> How many TT users would like to use the 320x480x256 colors (TTlow) and how
> many would prefer the wonderfull 320x480x256 grey mode ?
> How many for 640x480x16 ?
I'd like to note that the Falcon, while it can do 320x480x256 rarely
has software in that resolution. 640x480x16 is more typical.

Ok
Each users are welcome in sending there choice at jeu.tos@free.fr.

Thanks for your opinion.

What exactly do you mean ?
YM (you mean the Yamaha soundchip?) has nothing to do with MIDI,
so what kind of conversion do you have in mind ? Explain your question.

Hello,

From what I understand, unless things have changed, you need a 68030
CPU or better to run Linux on an Atari. Now, another option is NetBSD,
which is another Unix environment. This will work on a 1040. I know, I
saw it for myself.

> understand it.

"Full path" is eg. C:\gemsys\magic\start\test.zip, so the application
knows exactly where the clicked file is located.

"File name" is just "test.zip", so the application cannot know
where it is located.

Do some experiments with that tiny prg I sent you :-) Install
it as an application, change the settings, click on its "documents"
and see what is passed. Have fun. ;-))

> > In "Arguments" you set -xrg (with one space at the end, it is essential)

> Yes!!! It worked!
> That space at the end did all the difference, but why? What does the
> space represent?

Nothing. It's just a space ;-)
Without the space ZIPJR.TTP gets something like "-xrgFILENAME.ZIP",
which is incorrect, and with the space it gets "-xrg FILENAME.ZIP",
which is correct.
Try that with that little prg I sent you to see it for yourself.

> user-guide.

I missed the original message and some of the replies.

If someone hasn't already suggested it, the ARC.TTP should have lots of
options for extraction and adding files and etc.

If you haven't already you might want to mention that one can install a
program such as a text editor many times to view
different file types such as DOC, TXT, ASC and etc. I'm not sure if there is
a limit on the number of times one can install
a program as a .TTP to view different filename extensions.
However some OS replacements allow you to setup many filename extensions to
a program so that you don't have to
re-install the same program over and over as a TTP to use different filename
extensions. I know that Geneva allows this,
not sure if TOS 2.06 does as I don't use normal TOS 2.06 very often.

.TTP is a very interesting subject, an area that I think has been under-used
on Ataris. I'll try to dig up some better examples.

>(www.kodak.com) for $30.00. I don't have any cards to test it out with
>yet. Just seemed like to good of a deal to pass on.

Mike,

I bought one of those Accent card readers from Kodak too, but I couldn't get either Atari (MegaST4 and Falcon) to recognize it. Upon bootup, the computer would just freeze and the busy light on the Accent would stay lit. I'm using HD Driver 7. It worked fine on my PC though. I ended up returning it. :(

Keep me/us up to date if you can get it to work on your Ataris. Maybe I'm not doing something right...

Interesting. I found the microtech readers work fine. In fact I have 2 dual units in my hades060, that's 4 pcmcia slots. Got them all loaded with smartmedia. According to one of the manuals these card readers only read cards or the ibm microdrives, and will not work with pcmcia modems or other pcmcia style devices. I'm assuming the firmware is basically hard coded to mimick a SCSI HD in these units. Perhaps that's just microtech card readers that have this limitation.

I dunno anything about PCI. Ozk is the man when it comes to PCI and the hades. ;-)

How do I make menus in the new version of XaAES appear in the old-fashioned style and not in this illogical and unfunctional scroll manner? I hope you can do this somehow :\

Also, I tried the new XaAES on Aranym on Linux and to be honest I was not very impressed with its window management speed. AES4.1 (GEM.SYS) is much faster and has a better responsiveness in that regard. That was strange since I've heard that the reason XaAES was written is beacause of the speed problem with AES4.1. Do I notice this only 'cause the setup I tried it on was Aranym (some beta version) or I would get the same feeling if I was running it on an original Atari? Anyone out there with the same observation?

NetBSD need for sure a MMU too (like Linux). So the minimum processor
requirement is a 68030 or 68020+external MMU (the 68030 is just an 68020
with integrated MMU).

The uLinux is a Linux port to hardware architectures without MMU. It's
main purpose is for embedded architectures and it will not work like the
regular Linux (the very important fork() system call is not supported).

I don't know if it's still available, but instead of bying an internal
Screenblaster, you should instead buy a cheap oscillator and use Videlity.
The oscillator is just as easy to install, and much, much cheaper. Also,
you have a much wider variety of clocks to choose from. Take a look in the
hardware-section on http://atari.nvg.org/

Nenad,

You aren't crazy. I find XaAES to run a little slower then say NAES or maybe even GEM.SYS. However, XaAES is still in development so it's an unfair comparison. He may be using write and optomize later methods.

Hi Phantom,

P>.TTP is a very interesting subject, an area that I think has been under-
P>used on Ataris.
that's quite normal for I think that the TTP handling was a concession
to people using 'real' computers (console based) (e.g. mainframes,
workstations, PCs etc.) when GUI based computers (e.g. Mac, Amiga, ST)
came up.

I actually _never_ use TTPs on the desktop for eventual error messages
vanish too fast to be read (at least by me). I prefer a command line
shell like BASH.

Hi anarkissed

Before you do anything else do a manual degauss, if that improves it try it a few times until it cured, but leave a gap between each attempt, if that doesnt make any difference then investigate the degaus circuitry.

| I have a ACER 17" svga monitor on my falcon, and it is starting to give me too mucg
| green, and it looks like the convergence is going.
| the effect is a lot of fuzzy greenish text.
| is there anything I can do that could fix this? or is it on its last legs?

Remove the line
popscroll 6
from your xaaes.cnf

This setting was only provided to demonstrate the power of the concept
(and to have a laugh of course ;-)
All menus are equal in XaAES.
The feature is not entirely illogical nor unfunctional.
When a menu doesnt fit on the screen the menu is automagically made scrolling.
Such a thing might happen with dynamic size popups or submenus in lower resolutions.

> Also, I tried the new XaAES on Aranym on Linux and to be honest I was

> beacause of the speed problem with AES4.1.

That might have been the case in the very beginning of XaAES.
Now that it is getting more and more complete (and correct) it will execute more
instructions.

Nowadays XaAES most important function is to be free and have source available.

That is correct.
There is absolutely no redraw optimization in XaAES.
Not until the last glitches are repaired will I undertake such operations.
There is nothing to gain by optimizing code that in the end may have to be replaced.

>That's very interesting. I wonder if it would've worked on a 640x400 screen.
>The old Apple PowerBooks have a 640x400 screen in 4bit greyscale. I wonder

Probably. The displays in that range have a very similar interface
(excluding pinout), and grayscales are usually implemented using some kind
of PWM. The display we used was actually spec'd at 640*480 and 16 gray
levels.

So if you manage to get a 640*400 monochrome LCD display (with separate
4-bit data for upper and lower half), chances are good that it will work.

I have a copy of PCB Designer right here ;-)

What I don't have is the master disk, so it runs only as a demo. IIRC the
only restriction is in the size of PCB or number of connections, forget
which. It runs in ST high only.

I also have BRD -> Postscript and BRD -> IMG converters.

Email me with the address that you'd like the archive sent, I'll respond next
week or so as I'm a little busy ATM.

Hi, I'm looking for any info on this box. It doesn't seem to need any power supply, but I do need a m to m video cable to connect to the ST. I saw one at B&C for $20. Anyone know of a cheaper source, or is that pretty much it?
It has what looks like a svga(15 pin) and vga(9 pin) port. Any possibility I could just plug a regular pc monitor in?

It also has what I assume is composite video out, and audio, and sockets for both color and monochrome atari monitors, with a corresponding switch on the front. Also a floppy drive in, and a drive b, and c socket, again with corresponding switch on the front.

Thanks for any info,
Dan

>Interesting ! How many hands to use all that computers (-;

I guess quite a few Atari users here have many computers. It's easy to
become a collector by misstake :-)

I have:

3 x TT, 1 x MSTe, 1 x Mega4, 1 x Mega2, 2 x STFM, 1 x STacy, 1 x Portfolio,
1 x Lynx.

Add to that two Windows PC's and a Win-CE2 Cassiopeia pocket computer and
one realises that the room more or less looks like a computer museum.

Normally all except the Portfolio and Lynx are connected to a slightly
complicated TCP/IP network with a combination of Ethernet and nullmodem
cables.

Some might be interested to know that it works well to network the Win-
CE2 computer to an Atari STinG network by only using the sync cable. I
have written a text on the subject and will put it up on my homepage when
I get the time...

Right now three are 3 up and running: 1st TT (on 24/7) as main router and
running the webserver, 2nd TT for writing this and one of the PC's
because I did some surfing earlier today.

When all 11 computers are up and running it _is_ sometimes a bit hard to
remember which mouse/keybord goes to which monitor.

Ed,

I noticed this starting about a month ago for me. This morning I emailed my ISP about it, got a couple of thoughts from him, but no answer yet. He did say his servers only retain the previous 30 days of messages. He has just installed new newsgroup servers and they are not fully functional, so my problem may only be at his end.

The most interest thing and piece of information I received was this URL- http://groups.google.com/. What a find!

Google has a 20 year archive of USENET messages. What does that mean to us? They have over 141,000 posts for THIS GROUP ALONE!!!!!! I think that's amazing.

You can read and post replies there. Not as nice as using a dedicated reader, but still a plus to be able to get to old messages. In fact, I'm posting this after registering with Google. It seems to have just basic functions, but sure looks like a great resource for old information. It does have a search function, and it appears to search the entire database. I searced on "neon" and was pulling up messages from 1995.

It doesn't seem to have a means of automatically adding a signature, tho'. But having the old messages is worth that minor inconvenience. <G>

>I guess quite a few Atari users here have many
>computers. It's easy to
>become a collector by misstake
You're right: some of them could not be refused by
me. They were sometimes so cheap and still in mint
condition...Other ones costs a fortune but it is
worth it: Atari made some very peculiar machines!
Even up till today you still can find enthousiastic
people when they got their hands on a STBook...

>When all 11 computers are up and running it _is_
>sometimes a bit hard to
>remember which mouse/keybord goes to which monitor.
And not to mention the electricity bill....

About the collection: in my case can the same be said
about the software. I've got about everything (except
some real rare and exotic software), all in original
boxes and with original manuals. It's a great sight!

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 2 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

I think he had a problem with that site - he changed job or something
and can no longer access the site, looks like it's now been removed if
you can't get into it.

Try this instead: http://www.vianet.ca/~joshua/ - it's the 'official'
Eclipse/fVDI support page and contains a forum that Johan contributes
to.

Yes you are right. Illogical and unfunctional was a bad choice of words... I knew right away that this feature could be useful for small screens but was wondering why did it default to that... and it did because I changed the CNF file. This feature should defintely be kept, and its purpose in the future shouldn't be just to have a laugh. For example, really long menus that wouldn't fit on the screen could show in that way, whereas the rest of the menus show normal, as you already said.

I might as well use this chance to ask a theoretical question anybody out there who knows internals of AES. Would it also be possible to program the menus to be non-blocking? For instance, I beleive there is a new fileselector call in recent versions of MagiC, that displays the file selector as a window, hence other GEM operations in the background aren't interrupted. Could you program the menus in the similar way, so that applications could choose whether or not to continue redrawing their windows for example. If the application needs to continue redrawing the content of its windows, this new AES would ensure the right redraw rectangles are sent when wind_get() with WF_NEXTXYWH flag is called.

it is possible with some software, but it's a bit flakey, and ties up your
serial port.

You could buy a mouse adapter from ASP, top bloke he is, and then you can
use any PC mouse you like

It is a permanent feature already. The popscroll 6 gave me the opportunity to test
its working with the menus that are practically always there.
And then I decided to leave the command in.

> I might as well use this chance to ask a theoretical question anybody
> out there who knows internals of AES. Would it also be possible to
> program the menus to be non-blocking?

That is already done. Anything that has a slider in XaAES is implemented as a window.
I didnt have the desire to reinvent sliders.

Scrolling menus are in fact windows. So it was a small step to implement all menus
as windows. But because this was so new, I didnt want to make it the default.
Also it is difficult to forcast how existing programs may react.

You can play around with non blocking menus by adding the option nolocking to the
menu command in the cnf. When specified, windowed menus will play their role
in the window and rectangle lists and not lock the screen.

Nothing is guaranteed however, because it isnt yet official.
There can be undesired effects. I left it because more important bugfixing was waiting.

BTW. You may want to read the history file. It is primary directed towards programmers.
But not everything is unreadable for humans.

1021. Re: Mega ST2 with TOS 1.02?

Newsgroup: comp.sys.atari.st
Date: 2002-02-10 13:36:11 UTC
From: Dennis van der Burg <d.w.vanderburg@student.tudelft.nl>
Message-ID: <3C66774A.43C42E0@student.tudelft.nl>
Source record: 38175

Hi all,

thanks a lot for the feedback.
I now know the MegaST2 I picked up, with TOS 1.02, has no BLITTER chip. I tested it with an old demo (from Atari(?)) 'bird.zip' which I got from an ftp-site. The demo shows a bird flying across the screen, and it flies approximately twice as fast on my MegaST with BLITTER that on the MegaST2 with TOS 1.02 or on a plain STf.

So this MegaST2 must be an early one, since it has:
-no BLITTER
-TOS 1.02 (the original TOS for the Mega) instead of 1.04
-a cooler fan.

best regards,
Dennis

Source record: 38178

Hello all, this is the first and I post in this forum. I am surprised that they are still so many Atari users out there. I have thought that since Atari Corp was closed down, there's nothing new out there, that Atari is a thing of the past. In view of this committee, perhaps I will take up my old Falcon030 again. What I would like to know is, anyone knows how to network the Falcon on to a Ethernet network? At best Atari system is good as a hobby machine. Are there any new applications software for these computers? Are there any new hardware for an Atari? Any USB adapters for the Atari?

Technology moves on. Without a company to implement new hardware, it is difficult to really use an Atari computer for any serious applications. I will readily admits that I have lost touch with the Atari community. So I welcome any and all to help me get up to speed with this arena.

Thank you.

By the way, I am posting from Singapore. There is absolutely no more support for the Atari computer. Please point me to any web site where I can find information for hardware and software upgrade for a venarable Falcon 030. :-)

Regards.

Hello,

I'm looking to buy either a Milan040 motherboard kit or a Hades motherboard kit

I own an Had s60 and use it 12 hours a day minimal, everydays.
I never be sorry about my computer.

but I first want to get some critiques of these machines from people who

Bad things at first :

ISA ports are buggy : you can use it as 'rom port' (don't know what it mean) but as far I know it's not possible to use them as some signals are common for both slots. The ISA soundblaster never be used on Had s (h las !!) even with the heavy work of Erik Haal because of that.

Linked to this, the only sound output you can get are Yamaha ym2149 (same as 1984 ST...), or parallel sound (soundcard that plugs in parralel port as is sold for a ridiculous low price by Loic Sebald) that will bring you a good 8 bit soundblaster sound (free sound driver made by Didier Mequignon), and PCI soundcards with only 1 chip because of lack of doc.

We have PCI slots and are able to use about any pci card (except those who do direct pci to pci transfers) but manufacturers don't release any doc, so the drivers must be made from an heavy reverse engeneering of Linux drivers. That means lots of works and few drivers.
The author of Fvdi did a lots of work and managed to release free drivers for a couple of graphic cards.

Optimistic point of view : the productor of VODOO cards is more intelligent than other and give infos for all his cards, but till now nobody ever made a driver for one of those great cards. Maybe it's too much difficult ? Remember that all cards are working like Intel fashion and we work like Motorola (fortunately). But it should be possible.

Modem 1 is ridiculously limited to 19200 bps : what use ?

Good sides :
I could write pages about them.

Modem2 is used here at 230400 bps everydays with this good German modem.

68060 is really fast, and after some weeks of use, we just ask how we could use slower computrer before.
Didier Mequignon and few others made software (mp3 encoding is pure 68060 assembler, POV68060, INSHAPE68060) and and that just blow out your hairs : each time you were use to go to wc or take a cup of coffee when the computer was doing something long (mp3 encoding, raytracing, d frags, making big ARJ, writing

a CD, etc) you have to forget quickly this things or you'll piss in your pants,
burn your lips with too hot coffee, etc (-:
Had�s 60 is writing fast CDrw at x10, datas CD at x12, and audio at x10 or x12
depending the memory you have.

Data transfer here are 5200 Ko/s with my UDM100 hd.

�Stuff like how compatible are these machines to falcons

about 0,1%

�st's

No software that use Atari graphics because of incompatible with graphic card.
That mean no action game at all.
No software who access directly the hardware (soundtrackers).

All software that use legal system calls work really faster (x10 mini) and using
Desktop publisher ST mean real time display, Calamus drawings are about real
time (except if you makes 24 bits pages).
That means lots of softwares.

�what OS's will they run well

Mint68040 was tested here, but I don't like complex stuff so I use only Tos in
roms.

If you buy and Had�s for playing you may be disappointed, but if you want to
work (even only archiving), you'll be very happy.

NB : Edward would talk far better that me about playing with an Had�s as he sign
as "Gamer" and it is really a great guy with more knoweledges than me on many
things. He had an Had�s 60 with 256 Mo of ram (lucky !!!)

Regards

IIRC the latest version of XCONTROL tries to do determine this number
automatically- and if you add many CPXes you may get a message that
"no more... can be loaded..." ... when you "save" and boot the next
time, XCONTROL loads more CPXes- i.e. those that it could not load
the first time. (maybe it doesn't work exactly like this, I don't
remember the details... but I think that "number of slots" is not
manually selectable in the latest XCONTROL).

I don't know if 3.0 will run on a Falcon or not. Nor do I know about
using NVDI. That said...

I used the program with Neocept's Turbojet driver on a Mega 4 ST,
running it from the hard drive. The Turbojet driver let you print to HP
Laserjet II compatible printers. I used an old Fujitsu RX 7100. When
one of my sisters had the computer, she was using an SLM804. It uses
GDOS fonts. I used to own a Falcon, but never tried this word processor
there. This was my favorite word processor for a long time. I even
have a copy of Fontz by Neocept so I could add smiley faces and the like
to my default font. Since the Falcon does have ST High display
resolution, and NVDI will use GDOS fonts, it just might work.

If you are still interested, see me in email. We can discuss details
about the program there, as I currently have the Mega 4 ST up and
running for checking out my Spectre GCR and Mac software, and I can load
WordUp and test a few things if you'd like.

Yeah CAF 2.06 is the latest version (back in 1996)!
You can use the normalize function in Offline mode but go for
a cup of coffee,then...another option is...
...You can use in the audio mixer the AUX controls to maximize the volume
but it will not be a part of the final audio file.You must do a
"mixdown" but it's a little complicated...

I have a Hades060 with MiNT-Net/NAes and never boot to plain TOS ROMs. With this much horsepower it only makes sense to run a tasking OS. It is very stable for me. One must stick to clean GEM apps, games and such that use directy video access generally will not work. I have a SoundBlaster PCI 128 and I can play MP3 while online, there are drivers for this card at least. As far as compatibility goes, it's much like a TT with a video card but it goes way faster. My TT feels like slow motion now, painful to use to be honest. I also am testing a beta driver for the common 10/100mbps ethernet cards. I don't regret getting the Hades060 for a moment, in fact I wish I had gotten it sooner. The Hades has a modified TOS 3.06 btw.

1040. Hybrid Arts Source Code Released

Newsgroup: comp.sys.atari.st
Date: 2002-02-11 06:20:12 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0202102220.26e3eae3@posting.google.com>
Source record: 38194

Good news!

Calling Programmers!!

Got a BIG package in the mail with LOTS of discs from Tom Bajoras, ex-programmer for Hybrid Arts. He has released all the source code for his programs, and found the discs and sent them to me.

Go here:

http://groups.yahoo.com/group/atari-midi-archives/files/SOURCE/HybridArt/

For now, this includes:

CZ Android
DX Android (2 discs)
Ludwig
GenEdit (2 discs)

I still have to zip up about 4 to 5 discs of Easy Score Plus Source Code. This will come later.

Also included in his package are many templates and configurations for GenEdit. I still have to sort and Zip them up. I will post about it when I have completed this part.

I am pretty sure Tom Bajoras used magamax C to compile the source. What we really need is:

1. A unprotected version of DX Android, as we do not have a downloadable version even though Tom Bajoras has released it as freeware.

2. Unprotected Copies of ALL the programs, as the versions we have are all "libed" versions. The MCA dialogs have been removed, but a real version is much more preferable.Tom Bajoras has approved of these as downloads (of course)

3.Better versions of the programs...for example, a new version of Ludwig would be very nice!

I have also uploaded to the web master at Orphaned projects at Atari-source.com. Perhaps we will get some response there as well.

I think it is great that Tom Bajoras has decided to release the source code. It gives us another opportunuty to make things even better.If any programmers here can help, please contact me. We especially need #1 on the list above.

1041. HD Driver detecting ghost IDE drive

Newsgroup: comp.sys.atari.st
Date: 2002-02-11 07:33:48 UTC
From: puffpuffin@aol.com
Message-ID: <20020211023348.18476.00000001@mb-cu.aol.com>
Source record: 38195

Hi everyone. I'm having a problem with HD Driver 7.55.

I just formatted a new Syquest 270MB cart and I can't get it to boot with HD Driver. When I first boot up my MegaST4 w/TOS 1.4 and Link 97, it loads from disk first as normal. However, when it starts detecting drives attached, it displays the following:

IDE 0: ~-~-~-~[[--]] (other garbage characters)
ACSI 0: Syquest SQ270S

It looks like HD Driver is trying to find an IDE drive and trying to boot from it. However, I have no IDE drive connected. I only have my Syquest 270 is connected. It's ID0 and has been terminated.

To add to this, I also cannot access drive C:. When I try to install HD Driver on the Syquest, it only lists drive D:. I tried installing HD Driver on drive D and set it to boot from drive D under the General dialog box, but that didn't work. (I've ticked "ICD Compatible Host Adapter" too) Then I tried unselecting all the devices except ACSI 0 in the "Device Assignments" dialog box to no avail.

I even checked "IDE Drives" under Options, and the dialog box lists 2 IDE drives with negative sectors! Somehow the IDE drive checking in this version isn't working.

The funny thing is that I had this happen before, and I actually fixed it myself, but now I forgot what I did! Can anyone help? Uwe?

Thanks, Phil

> Thanks,
>
> Sam F.
> Seattle Seahawks fan & Atari Computer nut

I have a Hades060 with mint/mint-net and N.AES.
It works very well for me.
I am using the Hades:
- for program design (MyMAIL).
- as gateway to internet for my home network (8 systems is connected).
- for scanning with a SCSI flatbedscanner.
- PDF viewing/printing (Porthos) is faster than on my 800MHz PC

I have the folowing things in my Hades
1 CD-ROM (PLEXTOR ULTRAPLEX/40x)
1 CD-Writer (Yamaha)
1 Graphics card (ATI-Rage)
1 Harddisk (Fujitsu 20.4 GB IDE)
1 Harddisk (Fujitsu 9.1 GB SCSI/10000RPM)
1 Zip Drive (Iomega 100MB SCSI)
2 10Mb Ethernet cards
1 ISDN T/A (modem) (Connected to one serial port)
1 Flatbed scanner (SCSI)

Old games do not work on the Hades but newer like Doom and quake works
well and is possible to network.

Hi Phil,

P>However, I have no IDE drive connected.
in _that_ case you may 'hide' both possible IDE drives from HDDRIVER.
Even more I use to hide all unused SCSI-IDs in order to speed up
booting (disadavantage: a newly attached drive won't be found at once)

The German version of HDDRUTIL provides this feature by the menu
'Einstellungen' / 'Geri¿½te und Partitionen' (my translation: 'options'
/ 'devices and partitions').

What unadulterated BULLSHIT....Givent he same CPU speed (ST and A500), the A500 outperforms the ST by miles, better sound, better graphics, can store more on a DSDD disk...Basically the ST was shite, designed as a mediocre games machine which never quite measured up to the maturity and speed of the Amiga...

The Joysticks went into some stupid place under the computer, how freaking lame....

The sound was shite 4 bit crap (listen to Speedball2 on ST and then on the Amiga, or even better listen to Xenon II, the AMiga sound is so much better)...

YOu chatting crap about the ICONS?? Have you even opened your eyes and taken off your lame polaroid glasses?? What the hell was that bollox green/yellow TOS system??

The Amiga had better sound/grafix, it was more upgradeable and ran faster, higher MIPs. The industry speaks for itself....COmpare the amount of software released for the AMiga rather than the S(hit) T(hing)...

Everything about the ST was lame and shite, there is NOTHING, not a single aspect n which the Amiga is not better...

LAMERS.

Jeez, no wonder there was such a number of Atari-owner jokes out there...You people are definitely a few currants short of a fruitcake....

So, despite the fact that the Amiga hardware was better tan the ST, the only thing you can pick up is the Spanish meaning of the name...

WHAT DO YOU DO IF AN ATARI OWNER THROWS A GRENADE AT YOU?

Dear fellow Atarians,

just do not reply or followup to such idiots. It is not worth the time.
Real Amiga owners would be able to talk about good and bad things. These
crappy kids here just do not know what they are talking about.
I must admit the ST has many faults and is certainly not as good as the
Amiga in hardware respect. But making good effects without hardware support
requires emormous programming skill. Those Amiga kiddies just poked a few
bytes into their custom chips, a real ST user had to program this effect. And it
worked equally well.
If you don't like such posts here, just go to the next Amiga group and post
crap there.

ST owners, let those kiddies alone, they are not worth talking too,
especially as the Amiga vs ST debate is over for about 10 years with the
Amiga winning.

You show your ignorance by the fact that ST's don't have such green desktops
anymore. There are tasking OS kernals, and several desktops, but you are
commenting about stuff you know nothing about. There are models with
different hardware, you seem to focus on the first machine. My neighbor has
an amigo, I've seen it up close so do not tell me what I KNOW, it is slower
and has less hardware than a Falcon. Anyway no body cares really, both are
just as dead hardware-wize. I won't bother with such posts any further,
but I will say lastly Commadore went belly up first. We all loose because
soon you will have a PC anyway...

No point in trying to prove one machine better than the other. It's just not possible. Where Atari excelled in music and DTP, Amiga did likewise in graphics and sound. We're not calling the Amiga shite, infact, we should team up as fellow M68K users against PC lamers.

Atari did not excel i music...Er isn;t Music really sound at the end of the day? With your crappy 8 bit sound channels (Amiga had 12), Music on the Amiga was always better....Just cos the ST has built in Midi ports, people assumed it'd be good for sound...In fact Amiga's software based Midi programs outperformed even the ST's hardware...what a shame...

ATARI excelling in DTP?? HAHAHAHA....

>We're not calling the Amiga shite, infact, we should
>team up as fellow M68K users against PC lamers.

You 68000 lamer, I have a PC and it runs WinSTon faster than a real Atari....I can emulate a Falcon faster then the actual FAlcon...

I am not talking about the programmers, I am talking purely of the
hardware...Which you admit humbly that the ST doesn;t measure up to the
Amiga...A programmer would have to be exceptionally skilled to be able to
pull of something on the ST that can compare to what is easily done with the
Amiga....No doubt the programmers were skilled, they had to be...

Those Amiga kiddies just poked a few
>bytes into their custom chips, a real ST user had to program this effect.

Because the chipset was crap, yes....

Not possible, no Falcon emu to date can pull off DSP emulation.
I run an amigo emu on my ppc mac, goes pretty dam fast so what?
Everything has a pro or con, good or bad... I figured you had a PC.

Hm... I guess you're not settling this case. You'll have to go down in flames. You can't emulate a Falcon. There is no emulator for it's DSP which, by the way, kicked Amiga's ass. The Falcon killed any Amiga in sound.

Just ask someone about all the big hit bands of the '80s what they used to create music. Your answer will most likely be an ST. Nobody bothered using an Amiga for MIDI because you'd have to go through the trouble of getting additional hardware for it. ST has built-in MIDI ports and had the largest software base for MIDI than any other computer at the time. I still know of bands using the ST. Even the Falcon with it's direct-to-disk recording capabilities out-of-the-box was groundbreaking at the time.

DTP on the Atari was quite popular in Europe. Calamus was one of the most popular DTP programs and is still being developed for Atari. The TT030 in 1989 was a 32bit machine running an 030 at 32Mhz and a mono screen at 1280x960. Now tell me, was there an Amiga, that could top that at the time? I thought not. That was ideal for DTP especially paired with Atari's cheap but excellent laser printers.

I offered a truce by stating previously that both Atari and Amiga have their unique qualities. You'd be smart to accept that and not post anything stupid again.

Joshua.

1066. SCSI problems "cannot install hard drive handler"

Newsgroup: comp.sys.atari.st
Date: 2002-02-11 19:55:32 UTC
From: James <james5@nospam.com>
Message-ID: <UkV98.73155$Zc.20613718@news2.rdc1.mi.home.com>
Source record: 38116

I'm getting extremely frustrated with an atari mega st I bought recently. It came with an internal scsi hard drive. I would like to use a removable optical drive instead, however no matter what I do I can't get it to see any other drive on the bus. I simply unplug the minicontroller from the hard drive, and plug it into the scsi device I'm trying to use (i've tried several). I boot from the ICD floppy disk for my controller, and at bootup it gives the error:

cannot install hard drive handler
clock not present

then when I try to run any disk utilities such as ICDFMT or IDCHECK it finds no drives on the bus so I can't format or partition or anything. I have tried both ID0 and ID3, checked for proper termination. There is nothing wrong with my scsi drives they all work in other non-atari machines. I'm at a total loss what the problem might be, why is this not working? I'm assuming the problem is the controller driver is failing to load, but why is it failing to load? Only the internal hard drive seems to work, when it does it displays the current drive settings instead of the dreaded "cannot install hard drive handler" error.

Can anyone help me here?

No USB yet but there is plenty of other stuff.

CT60 - nearly finished and should be real fast http://www.czuba-tech.com/

Eclipse - PCI Adaptor, there is only drivers for ATI GFX cards at present
http://www.cortex-design.co.uk/

ROM Port LAN Adaptor - http://www.asamnet.de/~hilgarte/ether_e.htm

The ANIPLAYER site has some good info http://perso.wanadoo.fr/didierm/

There is also MINT and Magic which are much nicer Multitasking OSs.

Maybe you could talk to the people making HighWire, if you make the game standard (i.e. 640x480x16 or something) then it can be translated into whatever res you are using (mono, colour) - it would be a kind of web based game (using HighWire code as a plug in).

If the game will be stills then maybe you could go to DHS (I think they have this code) and have a look at some of their 320x200x4096 code, you can get some very nice reproductions that would work on an STE up (maybe even an ST with 512 colours).

Message-ID: <3c6846b7$0$209$626a54ce@news.free.fr>
Source record: 38126

STATUS : February 11th 2002
The CT60 is running at 66 MHz and the SDRAM controller is running at 66 and 80 MHz (!).
The 100 MHz boot is a success but the 060 stops after the white screen (videl initialization). It seems that the caches of the 060 can't run at 100 MHz (internal timing problems)...
It seems too that we have some internal problems at 80 MHz, even with a 60 MHz model...
Other tests coming soon...

CT60 at 66 MHz
SDRAM : READ (page Hit) : 133 MB/s - WRITE (page Hit) : 176 MB/s

People who have not yet order or pre-order should now wake up because the production of the CT60 is now being planned for the end of this month ! :-))))

I will produce a quantity = to the number of orders I received (122) + a little
(not enough for all late people !).

I have an HP Scanjet 3P but the only software that I can find is Nova Scan (and that is only a Demo), is there any other software out there? and will the 3P do colour?.

I also need some software which will allow me to put text, etc over the top of the pictures and ideally print it off (to an HP DJ 1200C).

I have a TT and a Falcon, the scanner and printer (one running Mint and the other Magic), NVDI, N.AES are all around here somewhere too.

I have spent hundreds of pounds over the past 6 months or so on Atari stuff and I would like this to be as cheap (or free) as possible as I only want to do it a couple of times for my girl friend (some project or other, a book cover I think).

OK, today a guy here in the trailer park cleaned out his work space, I collected all of the computer junk he had. I tore apart an old (1984) 8088 machine and got a good working power supply out of it, and it has a whole bunch of leans from it. I'll have to get me a multi-meter for sorting out the leads some time next month, now what I need is the order of the leads from the Falcon030 power supply, Mine is packed in a box, but I belive there's at lest 5 wires from it, I need to know their order and what power rating they are sppost to be.

I also got a ST-251-1, and a bunch of small 3.5 hard drives too.

Also, on my 1040ST I've got a useable KX-P1124 printer hooked up, but I don't know what all the fuction buttons are for or the other controls eiather. I have a 2nd one of those printers that will be put onto my TT030 so that once I have a keyboard for it I can use it too. But does anyone have a manual for this printer or knows the control keys order?

I've got to monitors I need to test and two tower cases with power supplys too.

I can help you on the PSU. Falcon needs +12v +5v and GND. The blue wire on the Falcon is +12v and the black ones are GND and the 2 red ones are +5v. You'll have to check the PC's with a multimeter.

Joshua.

I saw an Amiga once or twice. Never liked the thing as much as my Atari. So what if the specs on one outdo the specs on the other? If one enjoys their computer, that's what's important. I also have a G3 Mac, which way outperforms my Atari and Amigas, hardware-wise. But I enjoy my Atari more. That's my choice. It has nothing to do with which computer is technically better. It's absolute stupidity and beligerance to go into an Atari group and spout this crap. Until you have something truely productive to contribute, go away. And by the way... grow up. It seems that only someone with immaturity and inadequacy issues would post this kind of thing.

I watched a guy run an amiga when I went to his place, sure it could do
stuff my old 800XL couldn't, but I still have a 1040ST, TT030, Falcon030,
and hope to have them all up and running again by summer.

How does someone convert an .st disk image to an actual ST disk to use in a real ST? Is there a special program for it?

Thanks...

This is a strange problem, but you can simply ignore it and disable any
IDE devices. Please refer to the manual for details.

Note that for some devices a LINK96/97 is required. The ICD Link and
other links do not support some features (in particular initiator
identification) required for some optical drives.
It's less likely that this is a software problem, but you can easily
check this by trying the demo version of HDDRIVER
(http://www.seimet.de/hddriver_english.html) and checking whether the
device check finds the optical drive.

Hi,

Mosts of you are forgetting something, you're comparing an Amiga 500 with an Atari STF, the originals machines, but at the time of these, there was one big difference: THE PRICE ! the ST was a lot cheapier. It's like comparing two today's PCs, one at 1000$ and the other at 2000$, you can say one is a shitty thing but the price makes the difference.

Seb.

Yeah the KXP is a pretty good printer by my standards. It was probably the most widely used dot matrix in recent years in the office, and its probably the most durable too.

>additional hardware for it.

No the reason they used ST's for sound was because of misleading marketing
hype about the ST having built in MIDI ports so its better than the
Amiga...People assumed that was the case, in fact software based MIDI
emulation on the Amiga was better than hardware based on the ST....

>ST has built-in MIDI ports and had the largest
>software base for MIDI than any other computer at the time.

So what if it had built in MIDI ports, the hardware was crapper than Amiga
software...

>I still know of
>bands using the ST. Even the Falcon with it's direct-to-disk recording
>capabilities out-of-the-box was groundbreaking at the time.

I'll concede this minor point...

>DTP on the Atari was quite popular in Europe.

The Amiga was Europe;s best selling home computer....

>Calamus was one of the most
>popular DTP programs and is still being developed for Atari. The TT030 in
>1989 was a 32bit machine running an 030 at 32Mhz and a mono screen at
>1280x960. Now tell me, was there an Amiga, that could top that at the time?
>I thought not.

A4000 with a permidia grafix card and flicker fixer...No comment...

>That was ideal for DTP especially paired with Atari's cheap
>but excellent laser printers.

Hunh?? ATARI laser printers? I've never seen one...

Oh, so you want a shite monochrome display eh?
DTP in the 80's was Quark Express on the Apple Mac...An A3000 could run Shapeshifter, emulate the Mac at real-time speed and run Quark Express, which kicked Calamus...

The fact still remains that the Atari was crap and no mistake....Can you think of any computer made in 1987 (A2000) which can still take a PowerPC and a permidia grafix card?

Can the ST even come close to the Amiga in terms of expansion power? No...

Can the ST have USB connections? No...

In fact, at the time the shite TT030 was hatched, the A4000 had such an excellent Hard drive port that quantum used to test their new hard droves using that bus...

Just accept it, Atari never came close in terms of sales, games, architecture or popularity...and Atari died first...

And TOS couldn't even multitask on the ST...laughable...

Tramiel used to work for Commodire first anyway..So even the ST was indirectly created by Commdore's expertise, albiet a substantially poorer effort...

>based on the ST....
Oh, that is what is going on; you feel you're self
being subordinated by very clever marketing guys...So
you intended to believe advertisements...Says a lot
about your capabilities to judge a computer and its
functions. Never thought about trying one?....

>.Can you
>think of any computer made in 1987 (A2000) which can
>still take a PowerPC
>and a permidia grafix card?
but still has a interface that reminds you of being
developed in the attic...Never seen such a clumsy
interface not even on an old PC...

>Tramiel used to work for Commodire first anyway..
Listening to you as a representative of the average
Amiga buyer and consumer I can imagine (besides many
other reasons) why he left....

Reality is that both systems are dead and alive by
their current users. And the comparisons you are
making are completely out of proportion. But i guess
that working for a long time on a Amiga made you
sour....

Yes, I know Amiga was faster than ST, could display better resolution
in more colors and had better sound. And I know there were more games
for it. And I know that the games for Amiga were much better than
the ones for ST.
What's even more, I know that PCs are faster than Atari, can display
higher resolutions than my TT in more colors and can decode mp3
in real time. (BTW is it true that Amiga *1200* can play mp3? I heard
about it but cannot believe.) I also know there are more programs and
games for PCs.

But, despite the above, I use an Atari, and do not have any Amiga
or even PC. And, yes, I know it is crazy. But I like it.

I like the look of Jinnee desktop. I like the ability of Papyrus
editor to write from left to right, which is useful for me. I like
that logo which appears when I turn the computer on. I like not
to care about various viruses when I download my mail. And I like
that particular feeling of using such a weird old computer, because
I actually *use* it for certain purposes.

If I could afford it, I would buy a Hades instead of a PC. I cannot
tell you exactly why, because I must admit it is quite irrational.
Maybe it is because I used Atari computers since those 8-bit machines
they produced before Tramiels took them over: my parents bought me
an Atari 800XL when I was a kid.

I know that Amiga 500 does outperform 520ST in most ways (better
graphic, more colors, better sound.) I know that C64 outperforms
800XL in most ways (higher resolution sprites, full 256 character
set, much better sound). I know todays PCs outperform TT in any way.

AND SO WHAT? I DON'T GIVE A SHIT.

:-)

Actually, I can't see your point. If you need someone to agree with you that Amiga was always better, then I've just done it. Do you feel better with it? Happier? Fulfilled, somehow? I know sometimes people do need others to say "You're right", especially when they didn't receive enough care from their parents in the early childhood. This is a very important thing, lack of which may in rare cases result even in an introvertic psychosis, i.e. schisophrenia simplex.

So: You are right. Amiga was always better.

Which cost big bux I bet. We're talking out of the box mate. Sure, you can add all kinds of fun aftermarket stuff on a Falcon as well. Again, Falcon came with built-in DSP. Also, don't compare machines by price. Atari had cheaper but superior hardware than competitors.

I did say 'at the time'. Yes, a A4000 is a TT arse kicker BUT it came out in 1992!! We're talking 1989 here buddy.

> >That was ideal for DTP especially paired with Atari's cheap
> >but excellent laser printers.
>
> Hunh?? ATARI laser printers? I've never seen one...

Oh yes. The Atari SLM804 and SLM605. Yeah, do a little research on them. They're awesome.

> Oh, so you want a shite monochrome display eh?
> DTP in the 80's was Quark Express on the Apple Mac...An A3000 could run
> Shapeshifter, emulate the Mac at real-time speed and run Quark Express,
> which kicked Calamus...

A TT030 could emulate an 030 Mac as well, faster than the 25MHz A3000. We're not talking lame emulation here.

> The fact still remains that the Atari was crap and no mistake....Can you
> think of any computer made in 1987 (A2000) which can still take a PowerPC
> and a permidia grafix card?
>
> Can the ST even come close to the Amiga in terms of expansion power? No...
>
> Can the ST have USB connections? No...

Ok, the fact that Atari doesn't have PPC, USB and expansion capabilities like the Amiga doesn't make it a crap computer. Why the hell do you think I'm still using several? I had the choice of a Mac/PC/Amiga/Atari. I chose Atari because I liked what I saw. It's really a matter of opinion that can't be argued about. The qualities listed above are one of the areas that the Amiga excels over Atari. I admitted to that and you're just stating the obvious.

> In fact, at the time the shite TT030 was hatched, the A4000 had such an
> excellent Hard drive port that quantum used to test their new hard droves
> using that bus...

Again, 1989 vs 1992. No comparisson.

> Just accept it, Atari never came close in terms of sales, games,
> architecture or popularity...and Atari died first...

Atari didn't sell quite as well as the Amiga but Commodore died first.
Heheh.

> And TOS couldn't even multitask on the ST...laughable...

No, but MultiTOS could. And there are a bunch of other multitasking OSes
such as MiNT, MagiC and Geneva and a plethora of various desktops.

> Tramiel used to work for Commodire first anyway..So even the ST was
> indirectly created by Commdore's expertise, albiet a substantially poorer
> effort...

Well, Tramiel founded Commodore. I wonder where the father of Amiga worked
before? Hmmm.... could it be Atari? Yes, Jay Miner worked for Atari and
created such legends as the Atari 800.

Sounds like you're a bit jealous and trying to get what we Atarians have
that you don't with your Amoebas or Emulators or whatever you use. Go away
mate, we don't need the likes of you here.

Joshua.

I have seen them on various sites, but cannot remember where. I use the
accessary COPS which I like better. It works well on my Hades and my
STe. You might want to give that a try if you cannot find what you want.

Hello Sam,

I have a Hades060 and love it. As you can from my sig at the bottom, I have a number of OS's, a number of excellent programs and a number of peripherals hooked up to my machine. I have tried to run alot of Falcon programs and most of them do not run. These programs look for internal hardware that is only in the Falcon. There is a DSP card that is sold for the Hades, but I am not sure if that will help at all. I have gotten a fair number of ST programs to run. Most of the new ones work well and about 30-40% of the older ones work also.

I have an older version of the Hades motherboard and it has since been upgraded. If you getahold of a Hades kit, you will undoubtly have the upgraded one. I would contact Medusa Systems and see if Fredi has any motherboard kits left. I know they announced that they were not selling any Hades computers anymore as they were going to work on the new TOS machine which I am also looking into. I am sure if you really want one, you will have no trouble in finding one. Good luck and if you have anymore questions, please email me...

I may have to look into that as I have the older version of the Hades
motherboard and cannot get Ozk's PCI sound software driver to work
fully. I can play audio CD's, but cannot play any sound samples. I get
just static. I even ordered and installed new chips from Medusa. I
still think all that is needed is some re-programming for my version of
the motherboard, but Ozk does not seem to think so. But I am not a
programmer, so maybe he is correct.

>Modem2 is used here at 230400 bps everydays with this good German modem.

Which modem is that?? You must have good phonelines.

>No software that use Atari graphics because of incompatible with graphic card.
>That mean no action game at all.
>No software who access directly the hardware (soundtrackers).

I was wondering what would happen if I could run something like StonX
under Mint or Linux and see if I could load in some ST games. Everytime
I try I can get the sound ok, but no graphics as you said. My graphics
card does not have a 16-color mode.

>All software that use legal system calls work really faster (x10 mini) and using
>Desktop publisher ST mean real time display, Calamus drawings are about real
>time (except if you makes 24 bits pages).
>That means lots of softwares.

You are correct here. Programs that do run do so at a MUCH faster rate.

>&#65533;what OS's will they run well

Mint, Magic, Geneva and regular TOS all run great and offer a wide
selection of programs to choose from.

>If you buy and Had&#65533;s for playing you may be disappointed, but if you want to
>work (even only archiving), you'll be very happy.
>
>NB : Edward would talk far better that me about playing with an Had&#65533;s as he sign

>things. He had an Had&#65533;s 60 with 256 Mo of ram (lucky !!!)

Yes, there are not many Hades games out there, but there is one adventure game coming. Still, I have some games that do run. The programs from Patrice Mandrin run on my Hades so I can play the like of Doom and other ID games. The only thing is that I get no sound, which is ok. The games that do run are things like Solitaire, Chess, etc. If I want to play serious games I have my STe right next to my Hades. I can also hook up my 130XE 8-bit Atari to my Hades using a SIO2PC(ST) cable and have the Hades as an 8-bit disk drive. Oh, thanks for the compliment. I am a knowledgable user, but need more programming and technical experience. Take care all.

Hello James,

The ICD software is quite old. I would try another hard drive driver
like HDDriver. It is currently the best for Atari computers and is
still being supported/upgraded. You can download a demo at:

http://www.seimet.de/atari_english.html

I had the ICD software on my STe and was always having problems until I
installed HDDriver. Now things run faster and better. I will warn you
that if you have partitions on your hard drive past "F" they will not
be read by HDDriver. This comes from an incompatibility with the ICD
software.

Hello,

I have done this before, however you need a PC. There is a program for
the PC called ST-to-MSA. I got it off of the PacifiST homepage. This
exe program will convert the ST image to a MSA file. This MSA file can
be loaded into the Shadow MSA program (runs on an Atari computer) to
then be converted to the actual ST disk. If you cannot fine these
programs, email me and I will upload them to you.

Source record: 38059

Hi,

I really love my falcon, especially after my CT2 mod, but one thing has been bugging me from the start.
Why the hell did they ditch the YM shadow adresses? Many older programs use these registers, gaining a small increase in speed. These programs usually screw up completely, as access to these registers on a falcon generates a bus error.
I've been thinking a lot about this. It should be possible to create a small device that decodes this address space and generates chip select and any other signals needed to prevent a bus error.

Any further ideas on this subject?

/Peter

DO NOT BUY FROM THESE PEOPLE. I ordered 2 mice several months ago and
never received them. After months of complaining and threats, I finally
received a refund.

Also, they may charge $5 for a mouse, but they charge $10 each for
shipping.

Find yourself a copy of ST2DISK,with that you will not need to
dirty your hands using a PC or even any other programme. Once you
have this programme you will find a lot of ATARI programmes etc can
be downloaded from some of the Emulation sites. Mike Duncan in
Australia has even put 2 CD`s of .st images on the market,mostly
games,but some serious stuff as well. Find him as below.

Source record: 37921

Hi James,

J>cannot install hard drive handler clock not present
some early versions of the ICD software required the existence of an
ICD SCSI<->ACSI adapter.

J>clock not present
Usually the ICD adapter comes with a real time clock on board to which
the SCSI ID 6 is attached to.

Me personally I had to change from SCSI Tools to HDDRIVER because of
my optical cartridges being hard sectored to 2048 bytes per sector.
And SCSI tools was not able to handle disks with more than 512 b/s.

Try any ID-CHECK program to see if your optical drive is recognised
and be sure your SCSI chain is correctly teminated and TermPWr is
present. And follow Uwe's hints!

You may ask me more personally if you like for I have got some
experience with my Fujitsu MO 2513A (640 Mega and less) for a couple
of years.

Und TTschï¿½

�motherboard and cannot get Ozk's PCI sound software driver to work fully.

I think I read that his driver was very basic, so it maybe normal.

�I even ordered and installed new chips from Medusa

Wich ones ???

�still think all that is needed is some re-programming for my version of
�the motherboard

I have the older motherboard too.

�>Modem2 is used here at 230400 bps everydays with this good German modem.
�Which modem is that?? You must have good phonelines.

230400 on modem2, but 54600 on phone line.
All German modems are the most powerfull of Europe (ISDN= 2 channels in all
European countries except in Germany where they use 3 channels for a long time)
my modem is one of the cheapest : Elsa microlink 56 K fun.
The only bad surprise I got was the z�ro doc : 3 pages "hom to turn on a modem
and a computer" (-;

But the hotline was good.

�I try I can get the sound ok, but no graphics as you said. My graphics
�card does not have a 16-color mode.

Atari= bitplanes I think, graphic gards use 1 byte pro pixel in 256 color.
The vdi function VQ_trnfm is made to do that convertion, but the programm
should have been written with it.

Hi Peter

| I really love my falcon, especially after my CT2 mod, but one thing has
been
| bugging me from the start.
| Why the hell did they ditch the YM shadow adresses? Many older programs
use
| these registers, gaining a small increase in speed. These programs usually
| screw up completely, as access to these registers on a falcon generates a
| bus error.
| I've been thinking a lot about this. It should be possible to create a
small
| device that decodes this address space and generates chip select and any
| other signals needed to prevent a bus error.

I think using Backward solves this, but you could always graft in a YM chip.

> sound, but then the comparable a3000 (same price range) could be fitted with
> a 40 MHz Motorola DSP56002 DSP chip which kicked the Falcon's arse...

Your branching off into add-ons, why is it the Falcon did most of that stuff
right out of the box and you have to purchase it seperate? Think about it!
You are so full of it. That upsets you obviously or you would not be here.
A stock Falcon compared to a stock a1200, falcon wins hands down and there
was a tasking OS at the time.

> No the reason they used ST's for sound was because of misleading marketing
> hype about the ST having built in MIDI ports so its better than the
> Amiga...People assumed that was the case, in fact software based MIDI
> emulation on the Amiga was better than hardware based on the ST....

Microsoft takes that to another level, so it worked. Deal with it!!

Shape shifter almost ended up on the Atari, but was canned do to lack of
interest. Ponder that. We don't care about running mac software!
You obviously do in order to get around limits in your amigo software.

> Hunh?? ATARI laser printers? I've never seen one...

It's called research before you open you mouth...

> The fact still remains that the Atari was crap and no mistake....Can you
> think of any computer made in 1987 (A2000) which can still take a PowerPC
> and a permidia grafix card?

Permidia is utter crap by todays standards.. who freaking cares? We use
faster newer cards these days. Quote from an Amiga developer:
"Prior to Amiga's announcement, senior software engineers of Hyperion
Entertainment identified the key bottlenecks in the Amiga OS which hampered
the performance of our games: the slow 68K based filesystem, the 68K based
RTG system, the lack of virtual memory and the dual CPU architecture of the
current PPC boards which generates performance-crippling context switches."

The zorro bus has limits, it's horribly aged. I read the specs.

> Can the ST even come close to the Amiga in terms of expansion power? No...

It's the expansion slot that alowed you to keep up. Get it straight.
Expansion power on a bus limited to 80mb/sec, look it up dude, firewire goes
400mb/sec. You got firewire support?

> Can the ST have USB connections? No...

Sure. Someone just needs to sit down and do it. That's all.

> In fact, at the time the shite TT030 was hatched, the A4000 had such an
> excellent Hard drive port that quantum used to test their new hard droves
> using that bus...

That is BS, the amiga has one of the slowest HD ports on the face of the planet. That is why PPC cards come with HD ports to replace the crap design on the mother board. If what you say is true about quantum it's because they could read the bytes coming off the HD in realtime with their eyes.

> Just accept it, Atari never came close in terms of sales, games,
> architecture or popularity...and Atari died first...

Check the closing dates dude. Wrong again.

> And TOS couldn't even multitask on the ST...laughable...

Wrong.

> Tramiel used to work for Commodire first anyway..So even the ST was
> indirectly created by Commdore's expertise, albiet a substantially poorer
> effort...

The amiga was bought, they didn't even design it.
Infact Atari has alot more firsts under it's belt, far more than Cammadore.
Also there are more Atari clones, but then you are blissfully ignorant of that fact to. You really should just get a grip on the situation an accept that the Atari has it's place, it will free up alot more of your time.
None of us here are going anywhere based on a word you say.

They probably don't have anymore. Bruce at B&C hoarded them for
himself so that he can sell them for 7 times the price he bought them
at from this place.
Just like how he hoarded those 1040STs except he's selling them for 20
times the price he bought them at, and left people who wanted one out
in the cold and pay his outrageous price for one.

Assuming it's a 9 pin dot matrix printer, then it'd be either 1081 or 1180 (the 1180 replaced the 1081, and offered faster print speed, and a larger buffer [2k vs 1k] which is why I bought it in 1989 when it was released.

I have a STacy 2 on the way, and I've actually never seen one "in real life." I'm looking forward to receiving it. I read that it has a compartment for 12 "C" batteries. If these are ni-cad batteries, will the power adaptor charge them? Is battery life of 5 hours to be expected as the specs say? Are there any "weak points" in the STacy that I should look out for?

>PS. The accented "e" in your name isn't permitted by my email program,

I got lots some complains from ... atarists on French forum and I know about that, but without accent it doesn't mean anythings and I do my best to write only on atari forums not to bother people.

>does it? Has anyone told the author about this?

Sure, but changing my caracter set just for email mean too much reconfiguration to me : my config is now rather stable so I don't dare to change anything.

Regards

> software.

To be more precise: The ICD software's default partitioning scheme is
not compatible with the official AHDI partitioning scheme. This results
in AHDI compatible drivers not recognizing more than four partitions.
Note that ICD later offered an option for choosing the AHDI compatible
scheme, but as far as I know this scheme unfortunately was never the
default.
The HDDRIVER distribution includes a tool for converting the ICD
partitioning scheme to the AHDI partitioning scheme without losing data.

>functions. Never thought about trying one?....

Where exactly did I say I subordinate myself to advertisments?? Stop making up bollox..

And yes I have tried and used both ST's and Amiga's...I must say the ST is a shadow of its 16 bit equivalent....

>
>>.Can you

>>still take a PowerPC
>>and a permidia grafix card?
>but still has a interface that reminds you of being
>developed in the attic...Never seen such a clumsy
>interface not even on an old PC...

SO what? SO you are one of those people who bought the ST just because it looks nice?? Typical ST shallowness, Shalow users for a shallow computer...

The question was, can you think of any computer that that do what the AMiga does, way back in 1987?? No, so you sidestepped the argument by agruing about the looks....It may be clumsy to you, but thats because you would have trouble understanding how to fit the card in, being an ST user....why don;t you go and spray paint some pink flowers on your ST as well? That'll make it better than the Amiga...

>
>>Tramiel used to work for Commodire first anyway..
>Listening to you as a representative of the average
>Amiga buyer and consumer I can imagine (besides many

Hahaha the average ST user! How many examples can you thin of where an ST owner has actually soldered his own USB controller on?? Don't make me laugh....

If ST owners had any common sense they would never have bought the ST but the Amiga instead, so I'm afraid the very fact that you bought an ST instead of an Amiga convinces me that you couldn't even print your own name on screen in BASIC....

>cheaper but superior hardware than competitors.

Granted you had all that out of the box, but we are not talking cheapness
here, we are discussing superior hardware, which the Amiga had...One of the
signs of superior design is the ease of upgradeability, which the ST does
not have...

>
>That's just jealous bullshit. Again, ask Madonna for example why she chose

I'm talking straight out of the box....

>
>Well, Tramiel founded Commodore. I wonder where the father of Amiga worked
>before? Hmmm.... could it be Atari? Yes, Jay Miner worked for Atari and
>created such legends as the Atari 800.

The Atari 800 is something completely different...it was excellent in its
time, let's not get carried away, we are discussing the ST and the Amiga...

But yes, Jay Miner was fom Stari...maybe he saw the doom of the company
coming and descided to join the forward thinking hippies at Commodore...

>
>Sounds like you're a bit jealous and trying to get what we Atarians have
>that you don't with your Amoebas or Emulators or whatever you use.

Jealous of what??? What do you Atarians have?? A lower standard computer
than the Amiga, as you admitted above....

>A stock Falcon compared to a stock a1200, falcon wins hands down and there
>was a tasking OS at the time.

Haha I'm not upset, just amused at your post...WHy compare the FAlcon to the
A1200?? Why not compare it to the A3000?? The A3000 wins hands down every
time...

>
>Microsoft takes that to another level, so it worked. Deal with it!!

Yes, so you agree that marketiung can make a shite product look
good....thanks for proving my point...

>
>Shape shifter almost ended up on the Atari, but was canned do to lack of
>interest. Ponder that. We don't care about running mac software!
>You obviously do in order to get around limits in your amigo software.

Limits on software? Open your eyes, the AMiga software was miles
better....The amnount of software released for the Amiga was phenomenal,
compared to "lack of interest" in the ST, because developers knew a
fruitcake when they saw one...

>
>
>Permidia is utter crap by todays standards.. who freaking cares?

We aren;t talking "nowadays" are we? And you obvously care else you would
not have been in a lather and responded to my post...

>We use
>faster newer cards these days. Quote from an Amiga developer:
>"Prior to Amiga's announcement, senior software engineers of Hyperion
>Entertainment identified the key bottlenecks in the Amiga OS which hampered
>the performance of our games: the slow 68K based filesystem, the 68K based
>RTG system, the lack of virtual memory and the dual CPU architecture of the
>current PPC boards which generates performance-crippling context switches."

Yes but with all the "crippling" perfmroance above, those Amiga's were still
better that ST's in full speed...The AMiga was in another league, sure it
had performance problems, like a Porsche might have a performance problem if
you took the spolier off or something, but the spoiler-less Porsche still

kicks the Ford Escort doesn't it???

>
>The zorro bus has limits, it's horribly aged. I read the specs.

And the ST has even worse limits, ie it doesn;t even have a Zorro bus...

>
>> Can the ST even come close to the Amiga in terms of expansion power?
No...
>
>It's the expansion slot that alowed you to keep up. Get it straight.
>Expansion power on a bus limited to 80mb/sec, look it up dude, firewire
goes
>400mb/sec. You got firewire support?

Er, which Atari has firewire support?/ Please enlighten me...

Whats wrong with 80Mb/sec in the 1990's?? Thats excellent speed for its time. So what "DUDE"?? SO what of firewire goes 400M/sec??

The Atari doesn;t even come into the equation. It was just a toy knocked up quickly to compete with the Amiga, and as an afterthough the "home office" element thrown in hastily...Its just a sub-standard games machine trying to be what the Amiga always was...

>
>Sure. Someone just needs to sit down and do it. That's all.

Yes, some one can also sit down and theoretically stick a USB connection into a common calculator, but whats the poiint?? Waste of money cos a calculator is not designed for sophisticated things like that...

>
>> In fact, at the time the shite TT030 was hatched, the A4000 had such an
>> excellent Hard drive port that quantum used to test their new hard droves
>> using that bus...
>
>That is BS, the amiga has one of the slowest HD ports on the face of the
>planet. That is why PPC cards come with HD ports to replace the crap
>design on the mother board. If what you say is true about quantum it's
>because they could read the bytes coming off the HD in realtime with their
>eyes.

GO and look it up on the web, I cannot find the link but Quantum DID test their hard drives on the AMiga, because the port was fast...But regardless of twhether you believe that, the port was still faster than the Atari',s which is just a toy.

>
>> Just accept it, Atari never came close in terms of sales, games,
>> architecture or popularity...and Atari died first...
>
>Check the closing dates dude. Wrong again.

No you are wrong. What planet are you from?

>

>
>Wrong.

TOS could NOT multitask....You are obviouslt living in a world of your own,
so I'll not bother to disturb you....

>The amiga was bought, they didn't even design it.
>Infact Atari has alot more firsts under it's belt, far more than Cammadore.
>Also there are more Atari clones, but then you are blissfully ignorant of
>that fact to. You really should just get a grip on the situation an accept
>that the Atari has it's place, it will free up alot more of your time.
>None of us here are going anywhere based on a word you say.

Yes I have a firm grip on the situation...The Atari has its place way lower
than the Amiga...The point is the Amiga also has a place, better that the
Atari;s...

Of course you won;t go anywwhere based upon my words...You Atari owners are
like spoilt little brats throwing an irrational tantrum and refuing to
budge, even though you know the truth of the matter....This is what I expect
of an ST owner, because if you thought rationally, you would never have
bought the ST in the first place...

Nope.

> Has anyone told the author about this?

Sure, many times I think. But it is (was!) not in the first place when
he was still developping it :-(

> Last time I checked I think it used the Atari character set, which is no
> good when reading news/mail messages across platforms.

It doesn't do any translation regarding charsets. But it's possible to
use ISO charsets if the user _wants_ to do it ;-).

The first one to offer a solution was the well-known Martin-Eric, long
long ago...

I never think I could find a so stupid Amiga user !! I'm a Linux user
with some Atari machines and I know some Amiga users, and they're
cool. But this one... Hey you, what don't you have a little bit of
"tolerance" ? (maybe you don't know what is it ??). Ok, the Atari ST was
less powerfull than an Amiga 500, but is it a reason to think that it was
useless ?

Seb.

I do not think they can use SIMMs unless it has been upgraded at some point.

Does the mobo not have some spare places for chips, on my STFM there is a bunch of chips on the left and then a big empty section for some more chips (no sockets though). If I remember correctly you simply fill these up with the same chips and move a few other components.

Have a look at http://atarihacks.cjb.net/ as there may be something on there.

Elliot...

>Confirms
>my point that the amiga was better...
What does 'better' mean in this case? Purely a
benchtestresult based opinion, what means that you
let depend the outcome only on statistic measuring.
Better is also dependable on the way people use the
computer; it is much more complex than just a
onedimensional measuring. If somebody likes a
computer it'll influence his opinion about it: see
the way Apple advertises its computers because of
their 'humanistic' appearance (the smiling
computericon at the startup). I know people who love
to drive in their 20 or 25 year old cars. Not because
these cars run faster and smoother but because they
experience something more and else. If you narrow the
function and meaning of a machine only to its
performance you are yourself a poor 'narrowed'
person. Does what you are saying account for
everything you do and experience? (I hope not).
>How often did you have to move the power supply
>around once you had
>connected it??? Joysticks are different, you keep
>swapping them or the mouse
>etc...Its important for the joyports to be easily
>acessible which in Atari's
>case they weren't...So what of the power supply??
It's crap for a detail.....

>So Ataris wanted to attach themselves to
>M$ and kiss their arse by having a DOS standard
>format, "just in
>case"....how sad that Atari was even then looking
>surreptitiously to
>M$....C= didn;t give a flying fu** about M$ and made
>a disk structre that
>held more data, M$DOS be damned...
Is the world getting better by offering each other
hands or by denying the other platform and stay
overwhelmed by selfconfidence on your (Amiga)island?
I think it was a good thing to keep your disks
exchangeable with these MSDos machines...But i don't
seal myself off from the rest of the world as this
writer supposes...

And to get back to my first points: there is a lot what cannot be measured but influences the meaning and the function of certain appliances that you buy. Even so strong that is can become very individual and this will never be 'victimised' by a poor statistical valorization as a benchmark test or any other performance comparison...

Enjoy your machine instead of using it to formulate your frustation. It is staring to sound that somebody else shlould be attended by you (are there any shrinks that help people to loose their anxiety and anger when they switch world and childhood for other man's compueters?. This guy who does that is about to make a fortune out of your case...)

>Like I said, the Amiga is better but you people
>stick withthe ST purely cos
>of nostalgia and being stuck in the past...
Apart from if this is true what is the benefit of
having an Amiga over this argument? Does a Amiga give
you the impression that you are on the edge of your
time, that you are the 'avant-garde' of computing
when you switch on these dodgy machines with their
ugly interfaces? When I see the amiga interface it
reminds me of cars who have a lot of extra but
useless accessories: "Look this car has two handles
to start the windscreenwiper..And look how flashy it
is....."

>So: You are right. Amiga was always better.
Did that convince the entire computerpopulation?
Strangely in the days you are referring to (the 80's)
when Atari and amiga were on their heights it still
wasn't the popular opinion....Can you explain me that
without saying that all the people who did not buy a
amiga were ignorant and not so bright as you were
then...Because if that's the case evolution got
reversed....

Raoul Teulings

Sound like a worse case of religious
rethorics...Guess I missed this would be priest on
my cable....
>I;'m bashing the ST because you people are in
>denial...
That's what you get when they sell popuralized
editions of Freud for 4 year olds to amiga
users....Then they start to think that the whole
world is in denial or victims of hysteria (good
suggestion for your next postings: start convincing
everybody that Atariusers are suffering of several
supressions). Until now none of your sloppy arguments
did say anything to me or even start to make me
tremble and change my idea about the computer I am
using. Somewhere there must be a 'how to convince my
neighbour' teaching book for 8 graders what will help
your case. Good luck with searching...

>The amnount of software released for the Amiga was
>phenomenal,
>compared to "lack of interest" in the ST,
It keeps poping up: the (statistical0 idea that the
amount of programs say anything about the quality and
what users do with it...In Europe the Opel Corsa used
to be sold in the largest quantities...Does that make
ti a great car? Calamus can do thing a lot of more
expensive and overadvertised program can do
not...That'a what makes the qualitative
difference...Ripping is now common on other platforms
but could already be done by Calamus on atar's in the
days that you could only do it by hardware on a Mac
or PC...The extra device you had to buy for
simulating the same thing that Calamus could do by
software costs in these days about $ 4000! Still
these non Atarimachines were sold by great
numbers..Which do not prove your point but says that
something much more complex profounds the choice of
buying a machine..Still I am not convinced...

>Where exactly did I say I subordinate myself to
>advertisments??
You keep blat(t)hering about 'hype' etc!
>I must say the ST is a
>shadow of its 16 bit equivalent....
For being in the shadow of something it should be in
its proximity...You are doing that: I've never start
to compare these machines, mostly because they
perform differnt tasks and can hardle be compared to
each other. Except by people who are trying to
compensate for their misstakes in the past...

>SO what? SO you are one of those people who bought
>the ST just because it
>looks nice??
Somehow you have never learnt how to read: I bought
the TT for its performance and the average price of
software which made altogether it affordable. The TT
was then twice as fast as a Mac and half the price.
For what I wanted to do with my computer then the
amiga wasn't even in sight....The amiga could do some
thing the Tt could not but on the other hand the same
thing can be said for the other way round...
>.It may be clumsy to you, but thats because you
>would have
>trouble understanding how to fit the card in, being
>an ST user....
Why do I have to buy a computer and start immediately
sticking cards in it? Like I said: when I bought my
TT (I never started with an ST) it did what I wanted
it to do....

>were it not for him, the ST would be even
>more laughable compared to an Amiga...
I still have not the idea that that was a common
opinion thes days...But maybe I missed your 'light'
and that makes me a poor securalized
computeruser...(Never thought that the message of God
would be transmitted through an electronic
device...Speaking about laughable)

Jeez you are like a lameoid maer who doesn;t understand the concept of
Mhz...Just because a chip is running at slower Mhz does not mean it is
PERFORMING slower...if the shipset is better designed it can do more work
per refresh...The amiga had better mothrboard chips and a higher MIPS count
than the ST...

And wnough of your porkies about your Amiga "friend"..

NO wait, I have atari friends who say the ST was slower....

Hello,

I'm very happy to announce you that an important news is on my web site :
STATUS menu !

Don't ask me for a model 60 MHz of the 060 because I just got only 32 pieces
and I will not get others...it's rare !
So, only the first 32 orderers will receive a 60 MHz CPU, the others will
receive a 50 MHz model.

I'm a fulltime musician, and atari's were the first computer I'd ever used in '87. I pretty much used ST's in isolation untill 95 or 96, when I got a Falcon. At that time, I also began to find out about the internet, first through GENIE, later through the WWW. At about that time I began to hear about "flame wars," and heard about Amiga vs. Atari wars. I've never seen an amiga, and can't speak to them, so I won't even try. I can say that for a musician, the Falcon was a revolution in the 90's and is still an excellent tool for my work. This thread is my first glimps of the famous "A vs. A" wars, and I'm reminded of some wisdom I saw once on a bar room wall that I think applies here.

"It makes no sense to argue with a fool, because onlookers can't tell which is which."

Respectfully,

Wayne

I don;t understand....what exactly is your point here?

What overcompensation??

The point is thatthe ST was substandard to the Amiga, the TT was substandard in architecture to the A3000 and fully substandard to the equal-price-range A4000...

Bring your head out of the clouds, we are not talking about Freud or any of that shit....

>>phenomenal,
>>compared to "lack of interest" in the ST,
>It keeps poping up: the (statistical0 idea that the
>amount of programs say anything about the quality and
>what users do with it...

Actually having more programmers for a particular machine indicates its superiority, ie its a better architecure, better chipset, basic Workbench is multitasking whereas TOS was not etc etc...The number of programmers DOES say a lot about the quality of the machine...If the machine is crap like the ST, few programmers will want to waste time on its rubbish architecture when they can be swimming along on the Amiga with its large array of functions and possibilities...

Good programmers flocked to the Amiga, and few were left for the ST...

Programmers know a lot more about machine architecture than others, and if the chipset is cheap and low-spec like the ST, they don;t bother with it, or do bother but as an afterthought....

So you are wrong, more programmers DOES indicate a better machine.

>In Europe the Opel Corsa used
>to be sold in the largest quantities...Does that make
>ti a great car?

Bad example....more appropriate example, do racing drivers/rally drivers use Opels for rally championships? No they use BMW's or Mercs or souped up supercars...Because the Opel can't do what the BMW can do...

The Opel is for pensioners whereas the supercars (ie the Amiga) is for the professionals because its better than the Opel....

>or PC...The extra device you had to buy for
>simulating the same thing that Calamus could do by
>software costs in these days about $ 4000!

What extra device for what?? Quark Express on the Amiga kicked Calamus in the balls...

>Still
>these non Atarimachines were sold by great
>numbers..Which do not prove your point but says that
>something much more complex profounds the choice of
>buying a machine..Still I am not convinced...

OK, forget being convinced for now...But most Atari owners bought an Atari simply because Atari had a huge name in games software, and then realized their mistake after they discovered the AMiga far out-specced the ST.

Left with this problem and the fact that they could not afford to buy an Amiga as well, many ST owners banded together and pretended that the ST was OK. In fact it was a collosal waste of money.

Thats the only profound choice I can see...

Yeah whatever you say. Just face the fact that when you realized your mistake in wasting money on the ST and had none left over to buy an Amiga, you were so embarassed that you went into denial and now think that the ST was actually in some way equal to the Amiga...

Face it, you bought a toy and were forced to live with it for years, desperately trying to quieten the voice deep down inside that said "YOu fool you wasted your money"....

>ugly interfaces?

No its not cutting edge, I never said it was...Read the title, "The Amiga was always better"...better than the ST...

Dodgy machines? Ugly interfaces? Namecalling is all you have left, having no idea of the way the Amiga outclassed the ST in terms of specs...

The interfaces were very well designed and hidden away behind covers so they werent ugly...The ST didn;t even have interfaces, whch is why its pretty much useless at being upgraded (a big sign of crap design)...

>When I see the amiga interface it
>reminds me of cars who have a lot of extra but
>useless accessories: "Look this car has two handles
>to start the windscreenwiper..And look how flashy it
>is....."

So you are saying the ability to stick in a 1Meg expansion card is like having 2 switches?? What nonsense and utter tripe. The ST was the Skoda in com[parison, A skoda with a door missing and no place for a car stereo...

I have no hesitation in admitting that Falcons' direct to dsk recording and
DSP chip was ground breaking, but thats all it had.

The architecture of the A3000 and A4000 was much better in comparison.

Source record: 38039

Darkling,

In some aspects the Amiga 500 actually was superior to the ST, I agree. The gap became smaller when the STE arrived. Both machines have bigger borthers like the A3000/4000 and the Falcon/TT.

The differences you make so much noise about matters exactly jack shit nowadays.
There are also some clone systems available for both platforms. There is no point in comparing these, as they do not have that much in common with the original except that they are somewhat software compatible.

The operatingsystems on both platforms has evolved, they both run modern unix-ish operatingsystems.

By todays standard, these systems are so very similar. If I need horsepower, I use my PC. Nowadays, noone needs a copper, paula, or whatever. Not on my PC, atari, or amiga for that sake. The world has changed. Noone want's small jumping men eating mushrooms with lots of copperbars and cheesy samples.

I use both platforms, as I like their different qualities. It is obvious that you are fond of one of them and completely lacks knowledge of the other. Both have their strengths, try MIDI sequencing on your Amiga for example, and be amazed on how poor the software support is for that particular application.

I don't know what you want, besides bugging the hell out of this newsgroup. These machines are history, but there are a few enthusiasts left, on both platforms. There is no point in what you are doing. Grow up, stop wasting our time. Go play somewhere else.

Start a MAC-PC flamewar in some other newsgroup instead. There you actually have something to discuss.

/Peter

>But most Atari owners bought an Atari
>simply because Atari had a huge name in games
>software,
On what ground is that based? I just own three games for my TT. I've never been interested in playing games on a computer. I am interested in doing my job....
>and then realized
>their mistake after they discovered the AMiga far
>out-specced the ST.
Same nonsense: for my purposes nothing outclassed the TT. The psecs you mention are relative.
>The Opel is for pensioners whereas the supercars (ie
>the Amiga) is for the
>professionals because its better than the Opel....
Still confirms what I already said: you are a bad reader. the comparison was made because you stated that selling figures say something about quality. Selling figures say something about the amount of the products that are being sold. You make the same major mistake as a lot of people do: thinking that the amount of sold products say something about the quality of it. That is not always the case. Many people bought the amiga for it's gaming capacity. And a lot of them did not use the machine for professional reasons.
>What extra device for what??
I am speaking about ripping! Do you need glasses or don't you get informed before you start a childish quarrel?
>Left with this problem and the fact that they could
>not afford to buy an
>Amiga as well,
Once again: have you get a good contact with the grapevine? Because it looks like that that's your major source of information. How can you speak for all these people? Do you really think that they are now pulling their hair out because they all think they should have bought a amiga?
>discovered the AMiga far out-specced the ST.
I never 'discoverde' that because there was nothing to discover: it was already known and at the surface! That's why I choose for a TT....

And now I am wondering why I am doing soemthing that
is not even close to a discussion with an
illiterate...

Raoul Teulings

>
Midi sequenceing??

Argasm?
Octamed 8?

Midi sequencing on the Amiga was better and you know it...12 channel compared to the ST's 8 channel...The software support was immense...Read up on the Amiga before you make such statements...

>These machines are history, but there are a few enthusiasts left, on both
>platforms. There is no point in what you are doing. Grow up, stop wasting

Of course, since you cannot bring yourself to admit the facts, you have to take the higher moral ground and give me this trashy lecture about "growing up" and playing somewhere else...

>
>Start a MAC-PC flamewar in some other newsgroup instead. There you actually
>have something to discuss.
>

I am not starting a flamewar, just stating the facts....Its only a flame war because you ST owners get so worked up about it and start getting hot under the collar...Just admit the Amiga was better in every respect (A500 v ST)...admit it to yourself even though you don;t admit it here....

Off course Okami has no problems displaying his ï¿½ like he intended it to look like. The same happens when someone uses ï¿½ï¿½ï¿½ and Atari ASCII. Don't know about ï¿½ and ï¿½, though.

By using some small magic tricks Okami corrects errors like this.

>> ï¿½does it? Has anyone told the author about this?

Newsie has no support for anything but pure 7-bit ASCII afaik. So you have to stick to English to be understood by others except those who use Newsie or Okami.

>> Sure, but changing my caracter set just for email mean too much
>> reconfiguration to me : my config is now rather stable so I don't dare to
>> change anything.

In French I guess you would have to use characters like ï¿½ and ï¿½ as well. Note that these (in this text) will look very wrong in Newsie.

This was the major reason why I started to use Okami in the first place. I guess Mymail by Erik Hï¿½ll also has no problems with proper 8-bit ASCII in mail.

Hi Duckling

| If ST owners had any common sense they would never have bought the ST but
| the Amiga instead, so I'm afraid the very fact that you bought an ST
instead
| of an Amiga convinces me that you couldn't even print your own name on
| screen in BASIC....

Basic is for Amoeba game playing/writing owners, ST owners program in C or
Assembler.

Amoeba owners couldn't spell C without cutting and pasting it.

Hi!

Anyone have any info, and preferably docs, for FONTMACH.PRG, which is Font Machine by Volker Christen. This was on the /ST Computer/ Millenium CD. I have tried it out but can't quite see what it's meant to do. You can load various fonts -it's own *.FNC bitmaps as well as Speedo/Truetypes - and write to the screen with them, then save the result as an image. But there seems to be no zoom feature, so you are always seeing only a small part of the 'page'.

It's got quite a pretty interface, reminding me of Papyrus a bit. But as I say, I don't really see what it's intended for.

Anyone able to help?

Regards, /Peter/

And so they did in Okami too! :-)

I have a feeling the ligature characters OE and oe (which were the ones I
typed above) are not present in ISO-8859-1 that I normally use. Perhaps
this would have worked in some other ISO-8859-x variant?

Man this is a crazy discussion and I feel a little scared posting for help as an Amiga owner looking for help with my Atari TT030.

My two cents is this. The Amiga is an absolutely amazing piece of kit with some rather glaring shortcomings like any OS.

At first glance using a standard install, it looks rather plain and stale, but once you install the latest OS 3.9 released last year, you will be playing MP3s, watching QT and AVI files, etc.

However, all of this has to do with what you are willing to invest in terms of software and hardware. Because the hardware of the big box A3000 and A4000 are so modular, you can easily upgrade an Amiga to whip a PCs ass in every aspect except raw computing power, but with a simple '060 you will "feel" like you're running a killer pentium in terms of user response and seemless multitasking which still is for my money far better than any OS outside of a UNIX-based system.

On the flip side, I started my TT030 for the first time and went yuck! This is NASTY, but I remembered what a base Amiga OS install looked like and reasoned that it must be able to get better than this.

I was right! After searching the web, I must admit that it is much harder searching for information on upgrading Ataris than Amigas, but I did find some rather impressive gems out there and some very eye-opening examples of the power that a well equiped Atari can give.

So for me, I'm now on my journey to create my killer TT030. The trick is, I KNOW it can and has been done on possibly everyone in this groups Atari, but I am damned if I can find the source of a Video card or Networking card without chasing shadows all day or trying to reach someone in New Zealand.

Bottom line is this. I own damn near every computer from Coleco Adams, TI-99/4as to modern MacCubes, Sun and HP workstations and most in between including NeXT Workstations, Amigas, and Ataris. Each system has some unique magic silver bullet which makes it stand out from the others and I have also seen that each had a very unique approach to solving the same problems, but non really fully did it all.

My personal favs include Amigas (Insanely cool OS), NeXT (WAY ahead of it's time OS), and MacOS X (NeXTStep 2001)

As for Atari, I respect the hell out of the build quality, the DSP of the falcon, the slick and ultra cool look and build of the TT030, the fact that an entire OS is in the hardware and needs no disks, the ingenius laser printer that is both cheap cost yet high quality. On the downside,

the OS kinda sucks as standard. I don't think anyone argues here, but there are upgrades available from what I've seen.

So the winner in my opinion is a draw.

This is going to sound a bit wierd especially to most computer tech heads who live and die by the keyboard and email, however, I need a real Atari guru who knows Mint, Multitos, Geneva, blah blah blah really well.

Basically, I want to build up my TT030 and before I can begin with the questions on the usenet, there are some questions that I have that can probably be easier solved with a quick telephone conversation then I can get specific uestions over usenet.

Again, I know this is a little unorthodox, but it would help me greatly. if you can do it, please contact me at achaney@voicenet.com.

I'm even willing to pay a small fee for service if necessary.

Bullshit, basic midi isn't 16 channel...ANd even if the ST had basic midi 16
channel, naturally the ST developers put only 8 channel sound chips in
there...WHY???

The fact still remains, midi was better on the Amiga...Its just that people
bought the hype and thoguht "Oh Atari has built in midi ports so that must
be better"...

It says a lot about the superiority of the Amiga when pure software midi
emulation on the Amiga can outperform hardware based midi on the ST.

> newsgroups...

Ah, so you are the Amiga evangelist, out to save our poor lost souls? I thought that was Bill Gates' job! :) What do you have to say about the rest of my post, which you conveniently deleted? It was the most important part of what I was trying to say. Here, I'll repeat it:

"I saw an Amiga once or twice. Never liked the thing as much as my Atari. So what if the specs on one outdo the specs on the other? If one enjoys their computer, that's what's important. I also have a G3 Mac, which way outperforms my Atari and Amigas, hardware-wise. But I enjoy my Atari more. That's my choice. It has nothing to do with which computer is technically better."

Basically, my point is that a person's choice in computers is purely theirs to make, depending on what they need and want. If you like your Amiga and it does what you need, great! The Amiga is the best computer... for you! If I like my Atari and it does what I need, great! The Atari is the best computer... for me! Who are you to tell Atari users what's better for us? You simply become an annoyance and a hinderance to productive discussion.

>> Until you have something truely productive to
>> contribute, go away.
>
> Do you own this newgroup? I didn;t think so, so SHUT UP...

No, I do not own the newsgroup. However, the purpose of this newsgroup is to offer a place for productive discussion of Atari-related topics. It is not a place for trolling and bashing, which is not productive. Also, the converse is true. You do not own this newsgroup, either, so you have just as much of a right (or lack thereof) to tell me to shut up as I have to tell you to go away.

Please post a real e-mail address so I don't have to pollute this newsgroup any further responding to you.

Hi Elliot,
I'd also like to know. I have 2 Falcons (one minus a chip or two).
My UK keyboard version (bought new) says C-LAB Falcon MKI (no IDE drive
included) with a Rev A mother board . The French keyboard Falcon says
Atari Falcon 030 with a Rev B mother board (was bought used and had the
IDE cable plugged in). Seems like C-LAB used the older board!

When Atari stopped producing the Falcon, C-Lab bought the rights to
manufacture Falcons themselves. The Rev A is just the first revision of the
C-Lab board, not the Atari board.

The mark I is exactly the same as the original Atari Falcon, but with the
audio tweaked to give a cleaner sound

Last Atari Falcon sold on Ebay for $616 ! Tell me which Amiga sells
for this much ? You have Amigas for $25 and nobody bids on them. Atari
Falcon together with Nvdi and Magic OS kicks ass. Anyway go to a
browser and type in "amiga" and see what you get ? Atari has a huge
community here in USA and folks still develop programs for it. Go to
http://www.xtos.de/bilder/xtsboard.gif YEA thats a new ATARI coming !
With Motorola Coldfire CPU :) Go to
http://www.czuba-tech.com/CT60/english/overview.htm thats 060
accelerator for Falcon. Folks still support Atari everywhere and
build new things for it.

midi is nothing to do with sound chips or individual computers Atari
,Amiga,in fact it contains no sound whatsoever!! it is a control protocol
for interfacing musical instruments that it is still based on 16 channels
and banks of 128 + multiples thereof no one here is saying the built in 4
channel atari sound chip is great I for one have never used it but have used

many Ataris in studios around the world, and taken the much sought after STacy laptop with me . Did Amiga ever see fit to make a portable version to do all this fantastic stuff. have you amiga users run out of stuff to talk about on your own news group?

Wow! Thansks for all these links.

The LAN adaptor looks pretty "shakey"... Is there any software to run with it? If it's an Ethernet card, I assume it is compliant to IEEE 802.3 protocol (on ROM). Other network software to work with it? IPX? TCP/IP? Microsoft NetBEUI? Since Atari lived and died before the age of Internet boom, I can assume that these protocols aren't built-in into the OS ROM. Additional software or driver is necessary.

Oh the term "multitasking OS"... I guess I have forgotten all about it, since the various OS for PCs are now, by default, "multitasking OS".

Darkling -

From what I have read in all your posts, I have gathered that the real
issue is not about what computer is better or what have you... but the
fact is you have a small penis and you are trying to compensate for
that. Maybe you should move your posts to
I.HAVE.A.LITTLE.DICK.AND.I.AM.A.LITTLE.DICK

Have a nice day dick!!

Hi,

You could try to contact Panasonic to see if you can get a manual.
I burned out a KX-P1124 (I don't think it liked my data switch)
Traded it in for a KX-P1624 (no problems since)
then ordered the manual from Panasonic.

Try these numbers: Though they might be out of date
Options and supplies: 1-800-346-4768
1-800-926-2797

Hello,
Bellow is post from someone posting numerous msg's to usenet from what appears to be your system. This person is rude, and generating nothing but bad feedback and disrupting the entire group. Some people pay by the minute to access usenet and this person is generating needless posts and replies.

Is this person abusing their internet access at work?!
Can you put a stop to it?

Thank you for your time.
Lonny Pursell

You people should forget the ST, and remember and acknowledge that the Amiga always has and always will outperform the Atari...

So throw away those shite ST's and get an Amiga...you can get all the software on the Amiga, and better than the ST....

1231. Re: C-LAB Falcons

Elliot,

I have a C-LAB Falcon MK-II. I can't say much about the 1 but things I notice about the MK-II are as follows. Several motherboard mods (for stability?) The audio modification to remove bass boost as well as turn the mic jack into a line-in. The IDE is still there! It's just unused. They added an internal scsi jack (2.5" as well) and included a scsi drive instead of IDE for better performance, but my falcon currently has an IDE drive for boot and several scsi drives. (the SCSI 2.5" failed quickly after my purchase). I don't really think there was any other changes, but I could be wrong.

>Still confirms what I already said: you are a bad
>reader. the comparison was made because you stated
>that selling figures say something about quality.
>Selling figures say something about the amount of the
>products that are being sold.

No you are wrong. I wasn;'t talking about PROGRAMS, I said
PROGRAMMERS....Read it properly...I meant that the vast majority of
programmers in the 1990's went to the amiga instead of wasting their talents
on the ST, because they recognized the Amiga as a superior machine.

>You make the same major
>mistake as a lot of people do: thinking that the
>amount of sold products say something about the
>quality of it.

In fact it does, and by the way the OPel corsa was not the largest selling
car in Europe, it was the VW Golf, which is quality...Stop making up facts
as you go along...The Vauxhall (Opel) Corsa was never the best selling car
in any European country...

>all these people? Do you really think that they are
>now pulling their hair out because they all think
>they should have bought a amiga?

No I said they WERE pulling theirt hair out, and now they have decided do
stay with the ST out of nostalgia and pure sulking....

>
>"I saw an Amiga once or twice. Never liked the thing as much as my Atari.

But why? Because you did not know a good thing when youy saw one....YOu "saw an Amiga once or twice"...and out of pure whim you said "Oh I don;t like that"....What a stupid was to make a decision....Like I said, you never looked under the hood...

>So
>what if the specs on one outdo the specs on the other?

So what?? Why thats the whole point of this freaking thread...Have you been asleep?? Read the title of the thread, it doesn;t say "Amiga was always better but so what", it says "The Amiga was always better"....If you can't take this discussion I suggest you take your delicate disposition somewhere else...

>If one enjoys their
>computer, that's what's important.

That was never my point. Enjoy it all you want, for the nostalgia...But admit that it was outclassed by the AMiga...

> I also have a G3 Mac, which way
>outperforms my Atari and Amigas, hardware-wise. But I enjoy my Atari more.
>That's my choice. It has nothing to do with which computer is technically
>better."

Who cares about your choce?? As I said, read the damned title of the thread...

>
>Basically, my point is that a person's choice in computers is purely theirs
>to make, depending on what they need and want.

But as you said, you "saw an Amiga once or twice" and "never liked the thing"...WHat kind os a dumb whimsical way is that to make a decision??? WHY didn;t you like the AMiga and WHY did you like the ST? Did you have any reasonable logical reason for that decision?? NO YOU DIDN'T else you would have got an Amiga...

And the fact that you have a shite MAC confirms my belief that you are a poor mindless consumer...Its so interesting to see that ST owners are also those simpletons who go out and buy Macs...

>>
>> Do you own this newgroup? I didn;t think so, so SHUT UP...
>

>No, I do not own the newsgroup. However, the purpose of this newsgroup is
to
>offer a place for productive discussion of Atari-related topics.

I think the fact that the Amiga was its greatest competitor and won
outright, is a serious Atari topic...

I'm running the worlds only online atari ST bbs.. so I have
proof.. it can be done!

(telnet to shadow.skeleton.org, login "bbs" without the quotes).

If you have any old ST BBS games or utilities, let me know.. I've
got a public web site for peopel to downlaod ST BBS stuff (since peopel
only keep ST games around.. I want to keep ST BBS junk around :)

My system is actually an emulated atari ST running under unix,
with my bbs gear running in the emulator.

I've also managed to get it to work inside of STonX, and STonX has
been ported to windfows.. it is conceivable others could use STonX for
running an ST BBS in..

As a die-hard Amiga user, I will tell you that this guy does not represent me or anyone I know in the Amiga scene.

His arguement may or may not have merit, but for him to start this in this newsgroup proves him to be an ignorant half-wit, but to continue to feed his fire doesn't make anyone else any better.

I'm sure this will fall on deaf ears, but you know he will NEVER change his views. You know you will NEVER change yours. You know he is LOVING all the attention that he couldn't get in the Amiga groups. But you STILL continue to engage him.

So maybe you really actually enjoy this debate that is going nowhere. Maybe the battle between the Atari and Amiga camps is all part of the ritual fun. You decide, but I think I will still see another 80 posts of back and forth evn though it will lead to no logical end. Sigh..

>upper-case. Strange...

Did some reading on the subject and Okami sure does it right. When looking at my article in ISO-8859-15 the French special oe and OE letters displayed just fine.

Also checked with Outlook Express 5.5 and Google Groups and both wrongly inerpreted them as 1/4 and 1/2, so I guess they have no support for ISO-8859-15 and use ISO-8859-1 instead.

So I guess Okami really is a state of the art program for using different character sets on Atari.

>How does this work?:
>
>Swedish/German OE ("Ø" in HTML) = ï¿½

Wrong, should have been ï¿½ (like O [backspace] / on a pinprinter

>Swedish/German oe ("ø" in HTML) = ï¿½

Wrong, should have been ï¿½

>Norwegian/Danish AE ("&Aelig;" in HTML) = ï¿½
>Norwegian/Danish ae ("æ" in HTML) = ï¿½
>Norwegian/Danish/Swedish AA ("Å" in HTML) = ï¿½

All three correct.

>(I'm using MacSOUP on the Apple Mac, and it should be using the ISO
>8859/1 character set as far as I know).

Mostly this will work but sometimes someone might want to write these special French characters or perhaps the Euro sign that are all present in ISO-8859-15.

Sounds like the best you could do would be to Donate that machine to me,
then I can use it next to my TT030 which is STOCK but for the 2gi hard drive
in it.

Hi,

You could try to contact Panasonic to see if you can get a manual.
I burned out a KX-P1124 (I don't think it liked my data switch)
Traded it in for a KX-P1624 (no problems since)
then ordered the manual from Panasonic.

Try these numbers: Though they might be out of date
Options and supplies: 1-800-346-4768
1-800-926-2797

1250. Final answer

Newsgroup: comp.sys.atari.st
Date: 2002-02-14 16:41:44 UTC
From: Alexander Chaney <achaney@unix01.voicenet.com>
Message-ID: <cNRa8.631$yH5.108540@news2.voicenet.com>
Source record: 37946

I'm in need of help.

After seeing so many people BLAST that other Amiga guy in the debate of which OS is better, I think it's prime time for me to capitalize on all this energy.

I have a 8Mb TT030 with unknown HD size.

Easy questions:

1. All the combinations of replacement kernels, VDI, blah, blah has me totall confused. Please, what is the VERY best combination of products to have picture backdrops, multitasking, CLI, and colored icons?

2. Where can I find a network card? Any network card. Any for of networking will do, just so I can get programs off the net to the TT030. Could be modem, dont't care. What is the TCP/IP stack of choice.

3. What graphic card are/were available and what should I expect to pay.

4. What's the max ram and HD size I can put in my TT.

5. Where can you buy new/used software in the US these days. It seems that all the obvious places are out of business, etc.

6. What is the list of must have apps/utilities for a machine that will be on the web, need browser capability, ftp, write simple docs. IE. The killer appsss.

Now with all the banter back and forth about which system is better, I would think that these questions should be extremely easy to answer.

My ultimate goal would be to have ethernet networking, large 16-bit video minimum, tons of ram and preemptive multitasking capabilities and be powerfull enough to run the largest and most resource intensive application I can toss at it. I would rather have resources that I don't need than need the resources and don't have them.

Lastly, where are all the cool shareware and PD collection sites like the famous Aminet?

I'll let the post serve as the basis of, what platform has the best community support.

-Alex

1251. TT030 networking port

Newsgroup: comp.sys.atari.st

Yup. That's it. Internal SCSI, clock/audio patch and different badge was the
only difference. MKX was in a different case and came with an optional
internal SCSI and extra audio RCA jacks.

Source record: 37949

�I have a 8Mb TT030 with unknown HD size.

You don't know your own hardware : did you try hdddriver to know your hd
size ?

�Please, what is the VERY best combination of products to have picture backdrops

The software 'Horloge parlante' (acc+ little auto prg) running under Tos in rom
can tell you the time (on falcon), display background pictures (any Tos), and
offer you ramdisks up to 32 Mo.
It can be found on the Chapelie server.

>multitasking

Mint is good and free.
MagiC is faster and commercial.

�3. What graphic card are/were available and what should I expect to pay.

Matrix are ready for the VME tt bus and you will be able to have 2 differents
display in the same time : one on the TT monitor port and the other on the card
output.

�4. What's the max ram

I had 32 Mo TT ram and 4 Mo of fast ST ram.

>HD size I can put in my TT.

8 Go (512Mo x16 partitions) under TT tos, 16 Go with bigdos, more Go with Mint.

�Now with all the banter back and forth about which system is better, I
�would think that these questions should be extremely easy to answer.

Really ?

Regards

Hello All,
I have a C-Lab Falcon. What would I need and how difficult would it be, to re-case my unit in a tower case? Also, it has an internal 2.5" scsi drive, and also has what I believe is a bus for an ide drive. So, what do need to do to place an ide drive in palce of the scsi drive?
Any and all suggestions/ideas will be welcome,

Thanks,
Sam

For the IDE drive, you can either purchase a 2.5" IDE drive (as used in Laptop computers), or you can buy an adapter that you plug into the socket to allow you to use 3.5" drives, and even a CDROM drive if you wish. You can get hold of an adapter like this from ASP in the UK or Best Electronics in the USA, and I believe Conrad Electronics in Germany.

Hi!
Maybe you speak a little german, but i think Peter will speak english and so you can look at:
http://www.atari-fachmarkt.de/
They have a lot of Atari stuff and are friendly and help you.
Attention, they are a a bit expensive! :-)
(but the most other prof. dealers are more expensive the they... :-( )
If you want it cheaper you must look in internetboards or at Ebay. The biggest ebay market for atari is the german one. (www.ebay.de)

Good luck!
Axel

Hi Alexander

| As a die-hard Amiga user, I will tell you that this guy does not represent
| me or anyone I know in the Amiga scene.

As a die hard Atari user, i pretty much knew this anyway before one of you
guys said it!.

Real Atari - Amiga wars take place at Computer clubs where programers try to
eek the last 1Hz or 1 colour or 1 octave out of their smoking, cable bound
plastic boxes, the last to reach for the fire extinguisher is the winner,
its as simple as that.

> Octamed 8?

This is kid stuff, you realise this?
Try running one of the following on your Amiga. These are known titles in the music industry.
Cubase Audio
Logic Audio
Creator
Notator

Name it.
Trackers like Octamed etc cannot really compete with this. At all.

> Midi sequencing on the Amiga was better and you know it...12 channel
> compared to the ST's 8 channel...The software support was immense...Read
up
> on the Amiga before you make such statements...

?

OK. You don't know what MIDI is, this is obvious. You have _no_ idea what
you are speaking of.

The Amiga has 4 channels of 8 bit non-linear audio with low samplerate. No
MIDI interface, except for third party hardware. There are some 16 bit+
soundcards available, but the software base is... missing. There are no
proffesional quality midi sequencing programs worth mentioning, perhaps Bars
& Pipes, or.. .er... perhaps not, right. No 12 channels.

The ST has a simpler internal sound system. This is not used for much except
the meteronome in Cubase. It has a built in MIDI interface and lots of pro
midi software.
The Falcon has a kick ass soundsystem compared to any standard Amiga, it
supported by pro software like Cubase Audio, and it features a 56001 DSP for
effects etc. These things are available _as_standard_ without extra
hardware. You will have to pay a zillion bucks to get this on your Amiga,
and you'll have exactly _no_ software to use it with.

My falcon has 8 x 16bit balanced audio outputs, SPDIF, high quality external
A/D converters etc.

Prove me wrong. Give me links to the hardware and software that kicks my
current equipment and runs on one of my Amigas.

> >Start a MAC-PC flamewar in some other newsgroup instead. There you

> ST)...admit it to yourself even though you don;t admit it here....

So this is what you were discussing? Where did these 12 audiochannels come from? I used to program the Paula of the Amiga in assembler and it never had more than 4 channels. No standard amiga there. Just leave. This has no point.

1267. boot process of atari

(i come from the world of pcs so please forgive me if i make some awful
asumptions ;-)

how does the atari boot ?

is its OS code kept all in rom, or does the rom load the os from a floppy?

linux works on the atari right?

how does linux boot on the atari so that it can take over the machine?

how would i go about making an atari boot my own code from, say, a floppy
disk?
the reason i ask is since i am working on a hobby os, mostly for the PC, but
i want to make it easily portable, so i intend to also write a basic
functionality to boot on different architecture (M68k processor with MMU).

any links or books?

Ta,
Ben

let's try to provide an answer. The obvious ones are:
- original TOS in various versions
- TOS derivatives (MiNT, MultiTOS, Magic, EmuTOS, ...)
Unix clones include
- minix (small educational Unix clone that runs on a bare 68000)
- linux m68k (TT and Falcon?)
Other toys
- oberon?

> What are their pros and cons? What atari machines do they run on?

no idea.

Hi,

The atari ST has its bootstrap, BIOS, and GUI in ROM (well any atari ST
after ~1986)

No floppy disk is needed to boot to the desktop, though if there is no hard
drive, a blank floppy in the drive will speed up the boot process
considerably.

Linux is not available for the basic ST (something does exist but I nothing
"mainstream" i think).

If you write a program that runs under 68K then compile it and place it on
the floppy in a folder called "AUTO". When the system boots it will run this
program first. Other than that, you can put code in the bootsector of the
floppy, and make the checksum of the sector $1234. This will boot earlier in
the startup sequence than the auto folder one.

I don't know for others but I'll try not to be offended.

> how does the atari boot ?
>
> is its OS code kept all in rom, or does the rom load the os from a floppy?

very old versions of the OS were on floppy, with a simple boot loader
in ROM. Now the OS is in ROM. However on bootup it
- checks for some hardware cartridge and jump into them at some point
- after reset it checks and in some conditions it jumps to a
reset-resident programs
- it loads the floppy bootsector, and if this bootsector is
executable, it jumps in
- it then try to execute an executable boot sector found on hard
disks.
- finally programs found in the X:\AUTO folder are executed one
after another (where X: stands for the letter of the boot drive,
either the floppy or a partition in a hard disk)
- at last the desktop appears.

> linux works on the atari right?

It is said so, but I never checked, as I only have a bare 68000
atari or emulators.

> how does linux boot on the atari so that it can take over the machine?

I suppose it is run from the auto folder, or perhaps launched by
boot loaders that can be installed on the MBR of the first hard
disk, (like LILO?)

> how would i go about making an atari boot my own code from, say, a floppy
> disk?

simply ensure that the first sector of your floppy has the right
checksum. For details, just have a look at the source code for
EmuTOS, a re-writing of the Atari ST OS covered in GPL, at

http://emutos.sf.net

especially the files bios/floppy.c and bios/blkdev.c (for the
floppy). As EmuTOS is self-contained, and runs currently on actual

and emulated hardware from 68000 to 68040, I think you might
find other valuable info there.

So it seems. I think we had some conversation on the subject. Just tried the other day to run the Windows NAT32 using a modem on the PC and I failed to configure it properly?... Never got it to work at all, none of the other Ethernet networked computers got any packets in return.

>How do you run a Web Server on an ST?

Check out http://obooklage.free.fr/ where you can find Weblight. Runs with Magic or Geneva (without cgi) and possibly single TOS.

I have had Weblight online as my homepage now for over a year with almost no probles at all. 98.6% available checked by securityfocus.com since last April. It survived all the NIMDA and Code Red attacks perfectly. Especially NIMDA gave lots of traffic (up to 1000/day) before most other servers got cleaned up.

Unfortunately my provider has been a bit unreliable lately so it may be down sometimes:

> out for?

Joseph,

Don't use "C" cells! Atari tried it, and it doesn't work well (you
get 15 minutes per charge). With some expensive high-amperage cells
you can get 30 minutes, but internal packs just don't have enough
juice!

Three solutions (in order of preference):

1 -- take 3 6V sealed lead acid cells and clip them together to make
an 18V battery. At this voltage, you will use about 2 - 3 AH
(Amp-Hours) per hour, so if the batteries are all 6AH, you will get
close to three hours off of new batteries. Don't connect the
batteries permanently since you'll need to charge them with a standard
6V charger.

2 -- take a really big 12V battery. The STacy has a 'power low' light
that comes on around 11.5V. However, the STacy keeps running until
somewhere around 10.5V, so a big battery will work. (A small battery
will lose voltage too quickly, so you'll only get around half the
battery's rated AH.) I used a wheelchair battery (13.8V) to power the
STacy for over 24 hours a charge! It did weigh some 40 pounds though.

3 -- take a 'jumpstart' battery (which is really a sealed 12V) and an
inverter. This is a bit inefficient, but if I had a STacy today, this
is the way I'd probably do it so I could use the battery for things
other than my STacy. In fact, I own a Mac Powerbook with a bad
battery and use a 'jumpstart' battery to get many, many hours per
charge for about the same cost as buying a new Powerbook battery.
It's just heavier. Try
http://www.store4power.com/battery-integrated-products/battery-integrated-products.asp
if you need a source -- the xPower 300 would be more than enough.

Before I go on, let me note that I haven't owned a STacy in years. I
once posted the exact voltage figures to this discussion, but I'm
going off of memory, so don't consider the numbers in this post to be
precise.

Now for the weaknesses of the STacy. First of all, it uses a rather unusual SCSI 1 drive that is 1/3 height. They are quite difficult to find, so you'll probably have to treat it like a ST and use an external drive if you need more room. Secondly, the screen is not brightly backlit. Either use in bright light (I loved working on it outside with the backlight off) or use it in muted light. Typical room lighting is just enough to make it hard to read. Finally, there is a BIG trick to taking the case apart. You must remove the STacy decal under the screen to find two screws. With these screws removed, you can take apart the upper half of the case, thus allowing enough room to take apart the bottom of the case without breaking anything. Needless to say, taking a STacy apart without damaging anything is not trivial.

Believe it or not, I actually gave my STacy away -- a move I now regret. Good luck!

> Has 8859-1 been replaced by 8859-15 lately or something?

ISO-8859-15 (aka Latin 9) is not that new, maybe it's at least one or
two years old. It should replace ISO-8859-1 (aka Latin1), at least here
in France, because of some specific characters as said (OE and oe lig
for example) and elsewhere too because of the euro symbol. This one is
in the place (dec 164) where you can find the general currency symbol
(1) in Latin1, and a software following the rules should not be able to
post this one and the euro symbol... Some characters are also usefull
for other languages (z an Z with caron come in mind). Note that there is
also ISO-8859-16 in the work which also include the euro symbol.

(1) there are funny terms here to name the general currency symbol, the
famouest (sp?) one being "the arse hole" :-)

> What atari machines do they run on? Where can I get them?

Hi Kacper,

I'll just state a few of the most common OS here:

MiNT -- Multitasking system somewhat related to UNIX. Free, fast, and powerful, but considered a bit tougher than others to set up. Note: MultiTOS was sold by Atari and is essentially a very early version of MiNT.

Magic -- Commercial multitasking system. Hates most games, but has lots of features like now found on Macs and Windows. Please tell us your country if you want to know where you can find a dealer.

Geneva -- Commercial multitasking system that replaces much, but not all of TOS. Not as powerful as either of the first two, but considerably more compatible with older software and games. Sold by GRIBNIF and a few dealers. Tell me if you want more information.

TOS 1.x -- The original operating system. Based on your computer, either 1.4 or 1.62 is the best of the ST era TOSes. All all rather similar in terms of look and feel.

TOS 2/3/4 -- Improved version of TOS (2 for ST, 3 for TT, 4 for Falcon). Although once a suggested upgrade, now it is probably better to put your money into one of the first three, since TOS is not multi-tasking.

Conclusion -- if you are upgrading your Atari, you probably want MiNT or Magic, though Geneva is still worth looking at. All require at least 1 MB of RAM, and frankly, 2 MB is a practical minimum. In addition, note that you can alter individual parts of OS such as the VDI (video controller software such as NDVI or fVDI). You can also alter the desktop software (e.g.: Thing, NeoDesk, Jinnee) and each of these dramatically change the look and feel of the computer.

Galen

1286. FS: Falcon 040 system (Half price)

Newsgroup: comp.sys.atari.st
Date: 2002-02-15 03:03:29 UTC
From: Michael White <michael12@mindspring.com>
Message-ID: <a4htqd$e59$1@nntp9.atl.mindspring.net>
Source record: 37988
Cross-posted to: comp.sys.atari.st,dfw.forsale

I'm offering the following Falcon system for sale.
All hardware is in excellent working condition EXCEPT for the native video
output of the Falcon. There is a slight blue tinge that comes and goes.
This blue tinge is not present on the video card output.

$500 or best offer. Price does not include shipping.

----
o Falcon 030 in C-LAB MK-X Case
o 1.2 GB Internal Toshiba IDE hard drive
o Afterburner040 w/hardware switch to switch back to 030
o 36 MB RAM (4MB on board, 32MB on the Afterburner040)
o Nemesis accelerator
o Nova 64-bit graphics card with 2 MB VRAM
o QWERTYX AT keyboard/serial mouse adapter
o Mega STe keyboard
o Microspeed keyboard
o Mouse
o Motorola 28.8 external modem
o External monitor switch for Nova/Falcon video output
o All necessary interconnecting cables and power supplies
o 4.3 GB Internal IBM SCSI hard drive. This is currently house in a
case, and is required in order to boot MiNT.

Commercial Software
----
o NVDI 4.11
o Papyrus Gold 3.64 with 4.25 upgrade
o ProCopy ST
o SpeedoGDOS
o XBoot III
o Atari MultiTOS (upgraded)
o CAB 2.7
o CD Font Manager ST
o Extendos Pro
o Extendos Gold
o HD Driver 7.11 with 7.71 upgrade
o Thought - Idea processor (design tool)
o AtariWorks
o N.AES 2.0
o Straight Fax 2
o Flash II
o Bird of Prey CD (Floating Fish collection of Falcon stuff)
o Expert Software 2000 Fonts CD

o Bitstream 500 Fonts CD
o Selected Signs Font CD
o Speedo Superfont
o Wercs Resource editor
o Cleanup ST
o CD Writer
o GEMTrade German translation program
o MicroRTX
o ScanX scanner software
o UVK 2000
o MegaPaint CAD tool
o Radical Race (game)

Registered shareware
---
o Paula mod player
o CLA Digitial Circuit Designer
o Thing 1.27
o ANIPlay
o Others, I know....

Other software
---
o MiNT installed across both disks
o MiNT 1.12 currently running
o RPM installed
o SSL version of Lynx installed

I can be reached via email at michael12@mindspring.com, or you can
reach me by phone at 817-427-2129 in the evenings.

Thanks.

I have said this many times. The ST excels over the Amiga in MIDI, ease of use and the fact that TOS was more stable. The Amiga excelled in graphics and sound over the ST. Both are excellent computers and the fact people still use them is a tribute to both of them. Let's not bicker about this and just drop the subject.

The chips that went around the CPU that allow DMA sound. Before I
installed these, I got no sample sound at all from Ozk's driver. Now I
get the static. I also installed the chip that allow me to use EDO
simms in my Hades...

> an Amiga once or twice"...and out of pure whim you said "Oh I don;t like
> that"....What a stupid was to make a decision....Like I said, you never
> looked under the hood...

The couple times I saw it and got to really get my hands on it, I saw it in
action in a real-world senario, and asked a lot of questions about it. The
reason I didn't see it anymore after that was because no one I knew had one,
and I wasn't able to get back to the one I saw. Everyone I knew had PC's,
Macs, or Ataris. Also, the Amiga didn't have the music specs I needed (see
other responses people have made regarding MIDI and digital audio, which you
yourself said the Falcon was excellent for in its time). I also didn't like
the way the OS worked and felt compared to the Atari. It wasn't just a pure
whim. Also, you yourself have proven you don't know as much about the Atari
hardware as you proport to know, so which pot is calling the kettle black
here?

Never looked under the hood? I don't think the people who's Amiga I saw
would have like me pulling their computer apart.

>> So
>> what if the specs on one outdo the specs on the other?
>
> So what?? Why thats the whole point of this freaking thread...Have you been
> asleep??
> Read the title of the thread, it doesn;t say "Amiga was always
> better but so what", it says "The Amiga was always better"

First, don't take my responses out of context. That's a sure sign of
ignorance. I meant it to in relationship to the next sentence I wrote.

Ok, I'll humor you once again. Yeah, look at the title of your thread. Does
"better" to you mean pure hardware specs? That is completely obsurd. Any
good decision is based not only on pure specs, but practicality as well. Not
every machine is perfect for everybody, and every machine has advantages for
some and not others. You're saying that I (and every other Atari user here)
would be better off if I had gotten an Amiga. In actuality, I would have
wasted my money, because the Atari did *what I needed* better and cheaper.
"Better" means that it serves your needs more practically than anything the
alternatives offer. To me that was the Atari. For you that was the Amiga.

Your PC probably has better specs than your Amiga. Does that mean you should throw your Amiga away? Or does it still serve a purpose for you beyond the nostalgia? This is exactly what I've been saying all along. How can you not understand that this has everything to do with your thread?

> ....If you can't
> take this discussion I suggest you take your delicate disposition somewhere
> else...

I'm keeping up just fine, thank you. How about you? I haven't seen a whole lot of rational discussion from you. Instead, I've seen put downs, name calling, and foul language. That's usually the way to look for someone not able to take discussion. Last I checked, discussion meant calm, rational exchange of ideas, not "my computer beats up your computer". That's kindergarten-level threats more than discussion.

>> If one enjoys their
>> computer, that's what's important.
>
> That was never my point. Enjoy it all you want, for the nostalgia...But
> admit that it was outclassed by the AMiga...

Then what was your point? You said "Amiga was always better". Well, my basis of what's better relies mainly in how much I enjoy something and how useful it is. Specs are just numbers that are worthless if the machine doesn't work the way you need it and you don't enjoy it. If I don't enjoy it, then it sucks as far as my needs are concerned. Why can't you understand this?

Admit my Atari was outclassed by the Amiga? Why would I say anything like of the sort, when *for me* it wasn't true? Atari was very classy for my needs, far more than the Amiga was. If the Amiga was classy for you, great! I'm glad you have one!

And how is the Amiga any less nostalgic than the Atari? They are both pretty much in the same state as far as the computer market goes.

>> I also have a G3 Mac, which way
>> outperforms my Atari and Amigas, hardware-wise. But I enjoy my Atari more.
>> That's my choice. It has nothing to do with which computer is technically
>> better."
>
> Who cares about your choce?? As I said, read the damned title of the
> thread...

Once again... Who cares about specs if the machine doesn't work the way you need it to? Choice has everything to do with which is better, and so is everything in this discussion. If I had chosen to buy a computer that didn't meet my needs that would have been a very bad move on my part. That's why I bought the Atari. It was better... *for me*.

>> Basically, my point is that a person's choice in computers is purely theirs
>> to make, depending on what they need and want.
>

> WHY
> didn;t you like the AMiga and WHY did you like the ST? Did you have any
> reasonable logical reason for that decision?? NO YOU DIDN'T else you would
> have got an Amiga...

What an ignorant thing to say. You don't know me, beyond this conversation. You don't know how I came to this decision. You have no right to yell at me and tell me I had no logical reason to get my Atari. I always make every consideration before spending large sums of money. The Amiga wasn't equipt (without extensive upgrading) with the MIDI and other music-related hardware that the Atari had built-in, and I needed. I used on a couple time to see how it worked, and once I came to my decision, I didn't leave it at that. I asked around. Everyone I talked to confirmed my choice, including the store clerks, who sold both Amigas and Ataris and knew both quite well. Did you think so extensively about your choice when you bought your Amiga? I hope so, for your sake.

Also, on the topic of logic, why is it that when someone does make a logical argument, you either turn a blind eye to it or spout out "Amiga is better" propiganda or half-baked insults and leave it at that withoout further logical support of your position? Is that your idea of logic? Or are you just looking for a fight with strangers?

> And the fact that you have a shite MAC confirms my belief that you are a
> poor mindless consumer...Its so interesting to see that ST owners are also
> those simpletons who go out and buy Macs...

Look who's talking, PC-boy. Macs are much less a "poor, mindless consumer" thing than PC's are. And once again, Macs are better at music apps than PC's, and I like the way the OS operates better than Windows. Besides I still like the Atari better, like I said.

>
> Yes you are right, you ST owners ARE ignorant, however humility is the first
> step to wisdom, so it is good to see you humbly acknowledging the truth...

You're the one who said it, not I. Can you even keep something like that
straight? Sheesh! Is this all you can do, turn people's words around to make
a pointless insult? That's all this conversation has been from you. What's
your deal? Desparate for negative attention?

> The only inadequacy here is the ST's inadequacy compared to the Amiga...

If you are so sure of this, then why badger us to tell you what you are
already confident of? I would think that someone who feels that their choice
of computers is inadequate (whether that's the case or not) would be the
only kind of person that would even think of ridiculing an otherwise
peaceful group into telling him otherwise, which is exactly what you've been
doing, if you can't tell.

>> Why not just tell that to yourself and save us
>> all a lot of time and frustration?
>
> Why are you frustrated? Can't you handle the truth??

I'm not frustrated at all, although some here are. I'm a pretty patient guy
who's trying to make some logical arguments to your computer bashing stick
with you long enough for you to actually realize how dumb this whole thing
is. And truth? I've only seen insults and put downs. When you show me
something that even remotely resembles truth, then we'll talk about the
truth.

The truth is this: We all made our computer choices for valid reasons (I
assume you did, anyway), and neither computer is better than the other if
they are both useful to the one who owns it. Which one of us is badgering
the other about which computer we are using? The answer to that question
will point you to who can't handle the truth, because that person can't
handle the fact that computers are more than just the sum of their parts,
when put into the right hands. They are tools that get certain jobs done
better than other tools. Without a reason to be used, a computer is just a
pile of silicon, metal, and plastic, no matter what spec sheets say about

it. So lets leave it at that, shall we?

There's a difference between making a valid, on-topic argument and picking a
fight. You have done the latter, which is a lot more of a disruption to a
newsgroup than what Lonny said.

> If people
> don;t like the thread they won;t click on it. Are you suggesting people are
> too stupid to make that decisin? Who are you to control someone else's
> freedom of speech? Do you need to make the public's decisions for them?

You are absolutely right in that. However, there are rules and etiquette to
newsgroup useage.

Freedoms like freedom of speech, which you wielded in this post, only go so
far until they begin treading on others' freedoms. You are much closer to
treading on others' freedoms than Lonny is. Careful with who and with how
you choose to attack. It might come back to haunt you.

Dorkling,
You like the ST and thats why you spend time reading this newsgroup.
And you don't access this newsgroup at work because WalMart does not
provide net access to thier cashiers. Anyway, the ST community
welcomes you with open arms. I'm sure I speak for most of us here
when I say "Welcome new ST user!"

> Any and all suggestions/ideas will be welcome,

I've recased my Falcon in a mid-tower. It wasn't as difficult as I thought, although it would be easier in a full tower. I just didn't like the looks of enormous cases like that. I first had to drill throught the rivets holding the port cover, as the motherboard was too long to fit completely inside. I then had to make a small cut in one of the 5.25" drive bays to let the board fit on that side. Once that was done, I was all set. I wired the PC PSU to the Falcon, plugged everything in, and it's away it went! Next on my to-do list: 1. Making a spacer to extend the port cover to fit on over the motherboard, which I will then screw back on, 2. Making extension cables from the Falcon ports to the case's port cover, letting the connectors be accessible there, 3. Unsoldering the reset button, extending wires from its old connection on the motherboard so that I can get it into the spot where the case's reset button is. It's a long process, but it's not too difficult if you know what you are doing. I'm just learning this stuff with a couple engineering friends as advice, and I'm having a great time with it!

As for the IDE device, I think the IDE connector is still active in the C-LAB machines, so you just need a cable to connect to your drive, and possibly a 44-pin to 40-pin adapter, if you're using a standard 3.5" drive instead of a 2.5" portable computer drive. Good luck!

1299. Booting from SCSI card reader

Newsgroup: comp.sys.atari.st
Date: 2002-02-15 05:33:59 UTC
From: puffpuffin@aol.com
Message-ID: <20020215003359.09506.00000111@mb-mv.aol.com>
Source record: 37851

Hi everyone,

I can't seem to be able to boot from my new Microtech DPA PCD25BHSF card reader. This is the one with 2 slots: one PCMCIA which I use with a CompactFlash card, and one SmartMedia drive.

I'm using HDDriver 7.55 on a MegaST4 with TOS 1.4 and a Link 97. I've tried everything that I did with my Syquest (which boots properly now), but the card reader doesn't want to boot. The only way I can get it to boot is by having a floppy in the disk drive with HDDriver in an AUTO folder. Otherwise, the card reader reads and writes fine.

My other trouble is when removing the card from the card reader. If I remove one card, I can't read either card. I tried placing MEDIACHG.TOS in the AUTO folder that I'm booting from, but it doesn't help.

Has anyone else with a Microtech card reader try booting from an ST? And anyone know why others have no problem exchanging cards while I do? (Hi Lonny! :-))

Thanks for any help, Phil

It might be worth trying HDDRIVER 8.1 (demo version for a start).
What's the serial number of your HDDRIVER, BTW? I cannot find you in the
database of registered users.

Free - OK, but you need N.AES which is *not* free to run GEM applications.
Powerful - OK.
Fast - together with AES 4.1 it is grotesquely slow, together with N.AES
it is just very slow.
MagiC is much faster on original Atari hardware (ST,STE,Falcon,TT),
although certain versions might have certain problems with certain
Atari hardware ;-))

I will post my overview of Atari systems in a minute...

> What are the various os'es for the atari? What are their pros and cons?
> What atari machines do they run on? Where can I get them?

TOS - a singletasking system, in most Ataris it is located in
the ROM memory. Versions from 1.0 to 2.06 are for ST/STE models,
versions from 3.01 to 3.06 for TTs, versions from 4.01 to 4.92
are for Falcons. Hades uses a modified 3.06 version. I don't know
about Milan.

Lows:
- does not allow long filenames, only 8+3 DOS-like,
- no "real-time" sliders in windows,
- version 1.0 is terribly slow,
- it is impossible to change the language version without changing
the ROMs
- versions 1.0 - 1.62 have very bad desktop that really needs to be
replaced by an alternative one,

Highs:
+ does not take much memory (RAM),
+ does not need to be loaded from disk, so even when something crashes
it is always available,
+ most games run with it,

***

MagiC - a fast, multitasking system, available from ASH, take a look at
http://www.application-systems.de/magic/index.html
Works on all Ataris, even on 520ST, although 2 MB RAM is really needed,
and the more RAM the better. A separate version for Milan is available.
Versions 6 and up work on Hades as well.

Highs:
+ very stable on most Ataris,
+ extremally fast (faster than TOS and any other Atari system!),
+ the concept of multithreading and background DMA function is
very user-friendly and allows for example to do something else
while you're copying files using the desktop,
+ together with ASH Scripter and an alternative desktop Jinnee it
becomes even more user-friendly (one click to unpack an archive, etc.)
+ TOS and TTP programs can be executed in a window,
+ allows VFAT filesystem with long filenames,
+ due to external "winframe" shared library the windows look nice
and their look may be changed. Source code of the winframe SLB
is provided,

+ easy installation (just type in the serial number, click on OK and
it is installed...)

Lows:
- certain versions might be grotesquely unstable on certain hardware,
you really *HAVE TO* check if it works with your Atari (on some models
version 6.01 works great and 6.10 is unstable, or 6.20 is stable
while previous ones are not, etc.) It may be difficult, because it
is commercial and there is no demo version available :-(
- network support with I-Connect looks nice, but it's shit ;-) better
get MagXNet from http://users.otenet.gr/~papval/
- ehm... ;-)

***

MiNT - a free, multitasking Unix-like system for all Ataris. Separate
versions for 68000, 68020, 68030 and 68040 processors are available;
I don't know about 68060. Does *NOT* contain AES (GEM window manager) so
you have to get a *commercial* N.AES (from Woller Systems) if you want to
use Atari GEM applications.

Highs:
+ powerfull,
+ it's relatively easy to port Unix software,
+ very actively developed,
+ allows VFAT file system with long filenames and more filesystems
which drivers are loaded at bootup,
+ source code of the system is available,

(I believe MiNT users will add more...)

Lows:
- there is no good AES for it, so you are limited to command line
interface unless you buy N.AES, which is slow and not very compatible
with modern applications; there is a free AES (XaAES), but due to
serious bugs it is hard to use (it locks up, has some redraw problems,
etc.)
- hard to install. In the past it was almost impossible to install it
properly, because you had to chase through the net in search for
certain components. Now an "EasyMiNT" package is available, which is
supposed to do the task, but I heard some people have problems with
it.
- the threads (i.e. way the multitasking works :-)) are not compatible
with MagiC. The point is that some programs that actually can work
in threads support only the MagiC-type ones.

***

All abovementioned systems need also NVDI from http://www.nvdi.de/ - it
is a low-level graphic system extension (the part of the system that
draws thing on the screen or sends them to the printer, etc.) NVDI
allows you to use vector fonts (Speedo, TrueType) and external printer
drivers. It also contains some bitmap-handling routines that are

requied by certain applications (Papillon, GEM-Graph...) When using TOS
or MiNT, NVDI speeds up the screen display approximately three times.
With MagiC it only speeds it up a little, because this system is
already very fast.

***

There is also Geneva, which is a kind of multitasking AES for TOS. It can
be used with MiNT as well, but is slower than N.AES. Lack of "real-time"
sliders in windows may be annoying while using GEM applications.

Another systems available that I heard of are Linux68k, NET-BSD and
Atari System V, which is an Unix clone developed by Atari (?) for use
with Atari TT. Those systems do *not* allow to use Atari applications.

Dunno about Linux, but I recall some guy running MINIX on a barebones ST
with one of the olde "shoebox" HDDs attached, back in the late '80s...

And certainly we had a TT030 running a complete AT&T UNIX SVR4 system with
X-windows and Motif (I think it was Motif) on it (a bit unstable, but it was
a prototype, anyway). That was in '91, I think.

Hey guys,

Here's an update on the content you will find at atari-source.com
today!

Reviews:
GEMGT2 v.045
MyMail v1.54
Arthur 2002 beta
Mega Player 0.98 beta

The reviews are located under the "reviews" link on the side bar.
There are many more.

Articles:
Due to the recent tower case questions there is a guide with
photographs to putting a Falcon in a full tower case. It is a poor
job but at the end of the article is a link to a page that has a high
quality tower case job with pictures and illustrations.
A starting Guide to Emulators
The Great Hardware Upgrade Debate
An updated MagiC versus MiNT debate to reflect updates about MiNT and
utilities.

Also, I try to keep absolutely current with news following several
other news sources and try to create a collective news feed that
features all news relevant to advances in atari 16 bit computers (with
the occaisional off-topic piece of news).

No. It's an RS422 port. I've got a cable that goes
to my PC and it runs at 115K baud with no problems.

Using FreeMiNT too.

I think it's just the "timeout" value of the floppy drive having to
expire before the system finally decides there's no readable floppy in
the drive.

The system tries to read anything in the "AUTO" folder on the floppy
drive during the boot process.

If there is no disk in the drive, the system gets a read error and
retries until the timeout expires.

With a disk in the drive, the system receives a "file not found" error
immediately and moves on.

That's my guess, anyway.

BobR

1329. XaAES v0.941

Newsgroup: comp.sys.atari.st
Date: 2002-02-15 22:50:18 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3C6D9081.760A1D8E@chello.nl>
Source record: 37881

LS

There is a new version available on my homepage (url in sig).

1
Fix in wind_get(0, WF_OWNER, ...)
Fixes desktop draw failure in TeraDesk after selecting icons.

2
Fix in drawing the character of a boxchar object.
In 3D mode the character was always written in replace mode.

3
Implemented wind_get(WF_(D)COLOR).
Sliders in CAB 2.xx now look better.
CAB does some strange WF_DCOLOR calls which I dont have figured out yet.
As a result I didnt succeed in letting CAB draw the slider background
in dark grey.

4
It appeared that the mouse was not changed in graf_mouse() in certain
circumstances. Very confusing for most of the applications, and of course
their users. I lifted those restrictions.
This makes for instance snapshot.acc usable.

5
The fileselector didnt use the plain filename parameter at all.
This was already wrong in v0.7b.
Fixed.

6
Clip text to its object rectangle in all circumstances.
Fixes drawing problems in papyrus.

7
Clear the screen before closing VDI workstation.

8
Improved handling of disabled for all object types.
This affects disabled icons in CAB and LUNA.

9
Fix in writing G_IMAGE objects.

Replaced the images for extended button formats in boxchar widgets by icons.
These images do not perform as expected in the context for which they are
designed.

10
The setting of the sizes of the small (IBM) font was incorrect.
Fix in setting the small font cursor position.

Editing in 6X6 fields now works OK.

11
Fix in graf_dragbox and graf_rubberbox:
This all fixes the problems in INTERFACE editing a icon text or character.

12
Fixed a bug in resource handling.
This makes Jinnee start up.
Jinnee needs WDIALOG or N_DLG
I used Jinnee with N_DLG, which seems to work.
(As far as I got with Jinnee demo version.)

13
Implemented outlined border sizing using the right button.

Read the history file.
Have fun!

Absolutley, the timeout value is 30 seconds, the same as the printer
timeout.

>
> The system tries to read anything in the "AUTO" folder on the floppy
> drive during the boot process.

Well only files that end in .PRG and .TOS AFAIK.

> If there is no disk in the drive, the system gets a read error and

To allow people time to hunt for that boot disk, when they should have found
it "before" turning the computer on.

> With a disk in the drive, the system receives a "file not found" error
> immediately and moves on.
>
> That's my guess, anyway.

Well you are totally correct. :-)

BTW, that same port is also available on the Mega STE and the Falcon 030.
AFAIK there wasn't any software made by atari to connect machines up to a
network, which is a shame as even 115k would have been quick enough for
networking atari's. If anyone knows of any software that can be used for
that purpose under TOS or MagiC someone let me know - I have a falc and a
MSte on my desk that could do with starting a conversation. In the immortal
words of Cliff Richard, "Its so funny..... that we dont talk anymore.....".

Hi,

> As for the IDE device, I think the IDE connector is still active in the
> C-LAB machines, so you just need a cable to connect to your drive, and
> possibly a 44-pin to 40-pin adapter, if you're using a standard 3.5" drive
> instead of a 2.5" portable computer drive. Good luck!

Note - The falcon is extremely picky about the length of the IDE cable,
especcially accellerated machines. I can't get mine to work with cables
longer than 20 cm..

regards

/Peter

Normally a news/mail program _should have_ difficulties to display
Megamodï¿½ste's name in his _Newsie_ posts or any other "national"
characters as they are in Atari ASCII.

Did the name Megamodï¿½ste display correct in the from-field in his own
post? If so Emailer does the same tricks.

Well, STinG with BNeT does this very well. Also MagicNet with a Sambalike
client might be interesting to you.

http://users.otenet.gr/~papval/ is the url and you will also find a ftp
server there.

How do you connect this battery? When I got my secondhand Stacy many
years ago the battery compartment was empty with no connectors for
internal batteries or anything.

Will it work to just put in 12 V to the standard adaptor connector? I
have used an external 13.8 V power source as the Atari one broke down and
this works fine. Will the "power low" indicator light up when on this
external connector too? Perhaps the connector and the internal battery
was simply put in a parallel circuit?

>external drive if you need more room. Secondly, the screen is not
>brightly backlit. Either use in bright light (I loved working on it

Another tip is to use a desktop lamp(!) like the one that could be seen
on the picture on my home page. This will give a very clear picture but
with some minor interference with LCD frequence and the mains 50 Hz. You
have to look carefully to notice the interference, though.

Hi Ben

| (i come from the world of pcs so please forgive me if i make some awful
| asumptions ;-)

For which you will suffer severe insulting!. 8-)

| how does the atari boot ?

In General, at switch on the machine firstly checks for the precense of a cartridge, if the cart is present and is a bootable cart then control is handed straight to the cart, if no cart the floppy drive is checked for an executable bootsector, if so this will be executed, the actions following this will depend on the executed code, if the floppy is non-executable or gives a return to the OS then the ACSI chain is scanned for devices from numbers 0 to 6, if any contains an executable bootsector then control is handed to the relevant code, if the code returns control then the subsystems are initialised and then Auto folder programs are run and any accesories are loaded and run, control is now handed to the desktop, what hapens next depends on the user.

| is its OS code kept all in rom, or does the rom load the os from a floppy?

Only the early Atari's had the OS on disk and had a bootloader subsystem in ROM to load it.

| linux works on the atari right?

Extremely well, but only on 68030 powered machines i believe.

| how does linux boot on the atari so that it can take over the machine?

It patches into the hard disk bootloader.

| how would i go about making an atari boot my own code from, say, a floppy
| disk?

Write an executable bootsector or use a so Called AUTO-program, this is an app that resides in a folder called AUTO, on the atari system Any program that resides in such a folder is executed by the OS automatically.

| the reason i ask is since i am working on a hobby os, mostly for the PC,
but
| i want to make it easily portable, so i intend to also write a basic
| functionality to boot on different architecture (M68k processor with MMU).
|
| any links or books?

Millions, welcome to the internet..

HI Hallvard

| > No floppy disk is needed to boot to the desktop, though if there is no
hard
| > drive, a blank floppy in the drive will speed up the boot process
| > considerably.
|
| I've always wondered why this happens. Why does the drive keep spinning
| and spinning seemingly forever if there's no disk inserted, until the
| desktop finally arrives?
| What is the machine actually looking for using the disk drive when it
| starts up?

Its a TOS bug, never caused any harm so it doesn't get mentioned.

My MegaSTE doesn't do it.

Not on an Atari OS as the e acute (Atari dec 130) is not in the ISO
range and therefore is not decoded. This is a problem on PC, as well as
posts using characters in the range 128-159 of a PC may be difficult to
read on anything else but a PC.

Bye,
/Pascal/

Never met such a stubborn person before....What are
you trying to achieve? I am not talking about better
of worse (that's your habgup..) but about being
different.

>Like I said, the amiga is in a class of its own...
Wish you stayed in the first class you ever went
to...

>Yes, but whats MAC got to do with this??
That was the only comparison at that time valuable
for me: Atari and Mac were doing great things then
concerning DTP. And I am not saying as you are
implying all the time that the amiga could not
perform that but it just did not come to a comparison
because at that time Atari's and Mac did it for me...

>HAs this simple message managed to penetrate your
>thick cranium??
Why do you have to go into this over and over
again...Loosing grip? I haven't read any comment on
one of the posts from here with really contained
facts...So it should be loosing grip...

Oh dear, you asked a lot of questions eh?? Who did you ask? Some 10 year old
school boy??

>The
> reason I didn't see it anymore after that was because no one I knew had
one,
> and I wasn't able to get back to the one I saw.

This is just too funny....Inside the mind of an ST lamer...SO, lets get this
straight...you never really saw an Amiag afterthat, and so your
HOmer-Simpson mind said "Ok brain, its just you and me, if we can't see an
amiga, it doesn;t exist, lets buy an ST"...

YOu werent' able to "get back" to the one you saw?? Perhaps there was an
obstacle in your way, like a door or a wall....

Did you not have the mental capacity to buy some computer mags and truly
compare the 2 machines? Or weven go down to a local dixons???

>Everyone I knew had PC's,
> Macs, or Ataris. Also, the Amiga didn't have the music specs I needed (see
> other responses people have made regarding MIDI and digital audio, which
you
> yourself said the Falcon was excellent for in its time).

>I also didn't like
> the way the OS worked and felt compared to the Atari.

Of cousre, you preferred the shite yellow/green display on the Atari
compared to the vastly better Workbench...LIke I said, your agrguments are
hollow and everythign I would expect from an ST owner...

>
> Never looked under the hood? I don't think the people who's Amiga I saw
> would have like me pulling their computer apart.

Ever heard the expression "a figure of speech"??? I didn;t think so....the
green/yellow display on the ST would have addled the mind ages ago...

> Ok, I'll humor you once again. Yeah, look at the title of your thread.
Does
> "better" to you mean pure hardware specs?

> > I think the fact that the Amiga was its greatest competitor and won
> > outright, is a serious Atari topic...
>

> Yeah, maybe 10 to 15 years ago. Did you miss the memo? The war's over.

Thats all I wanted to hear, ST owner...

And people like you carry the war on...>
>
> Oh, is this the end? Still no real name and e-mail address, huh? Scared?
:)

Oooh I'm really scared....

Bullshit, whats Octamed sound studio??? Betterthan hardware based midi on
the ST....

>
> I have accellerated Falcons and MSTE:s. What Amiga will spank that for my
> purpose (audio)?

A1200 with PCI bus board+ any pci sound card of your choice (take note A1200
is only an 020)...

>
>
> Go play somewhere else. For my uses, the Amiga is extremely inferior.
> (again, audio)

ST sound is shite..you are living in denial...ANd why are you using an Atari
for audio??? WHy not get at least a PC?? The reason is you are cheap and
arestill using an ST from years ago...and cheapness was also the sole reason
you bought the ST in the first place...Quality costs money...

>
>
> This is kid stuff, you realise this?
> Try running one of the following on your Amiga. These are known titles in
> the music industry.
> Cubase Audio
> Logic Audio
> Creator
> Notator
> Name it.
> Trackers like Octamed etc cannot really compete with this. At all.

Octamed sound studio kills all of them...
Also, Bars and Pipes was so good that M$ bought out the comany and used the
technology in Windoze...

>
> My falcon has 8 x 16bit balanced audio outputs, SPDIF, high quality
external
> A/D converters etc.

My A1200 with a Soundblaster Live has SPDIF and digitail optical I/O...and
thats comparing a theoretically weaker Amiga to the Falcon...

>
> Prove me wrong. Give me links to the hardware and software that kicks my
> current equipment and runs on one of my Amigas.

It won';t fo you any good, since you make decisions based on whims and good
looks...There are many links out there, I don;t need to find them for you...

>
> > >Start a MAC-PC flamewar in some other newsgroup instead. There you

> the time, unlike the Shit Thing...

So you think Amiga MIDI is better because you can upgrade their cards? That
proves nothing, as you make no mention about how good the cards are to begin
with. Especially, as they apparently need upgrading. And you *can* get
alternative MIDI hardware for the ST (if you need multiple ports, etc.), so
the Amiga's not alone in this.

>> The Amiga excelled in
>> graphics and sound over the ST.
>
> Lamer, isn't midi a prt of the SUOND category??? YOu prove my point, the
> Amiga is better in both respects...

Yet again, you prove you know nothing about MIDI. It has nothing to do with
the ST's sound capabilities. MIDI is simply a serial port that sends data,
not sound, to keyboards, drum machines, etc., which make their own sounds.
Beyond this, MIDI has nothing to do with sound. Without a keyboard to hook
it up to, for example, you basically have little more than odd looking
serial ports. No sound is produced by them at all.

> school boy??

Are you really this stupid? I asked the University professor who owned it,
and as I mention later (didn't you read?) I asked sales representatives who
deal in Amigas and Ataris and knew a lot about both.

>> The
>> reason I didn't see it anymore after that was because no one I knew had

> amiga, it doesn;t exist, lets buy an ST"...

You have a short memory. This is in response to your statement that I made a
bad decision because I only saw it in a real-world situation a couple times.
Had I the opportunity, I would have played with the thing more. I did know
they exist, hence the reason I went on to ask Amiga sales reps. I didn't
just buy the ST without extensive consideration of other platforms. You
couldn't put these simple pieces of information together on your own? This
explains a lot...

> YOu werent' able to "get back" to the one you saw?? Perhaps there was an
> obstacle in your way, like a door or a wall....

There was an obstacle, like I didn't know the person who owned it. I saw it
with an aquaintance of mine who worked briefly with the man, and shortly
thereafter graduated and moved away. After that I never saw the University
professor who owned it, and as I said, I didn't know of anyone else who had
one.

> Did you not have the mental capacity to buy some computer mags and truly
> compare the 2 machines? Or weven go down to a local dixons???

I had a couple subscriptions to magazines containing both Atari and Amiga
onfo. They all said that both computers had their good and bad points, and

that the Atari was stronger in the MIDI/music field. Besides, you really
can't compare machines well without actually getting to use them a little.
Specs are only a small part of the entire picture when purchasing a
computer. Never heard of Dixons. We don't have those here, I guess.

>> Everyone I knew had PC's,

What kind of arguments have you given so far? You make statements, but don't
give any hard evidence, and instead throw around half-baked insults. In this
post alone, you made lames joke about a 10-year-old and Homer Simpson, and
insulted my mental capacity. How does this further your argument? This is
all I've seen from you. I have given you detailed information about my
experiences with the Amiga, and reasons for my purchase of the Atari. From
you I have not seen any objective and truthful information, I've not seen
any iota of rational thought, and I've not seen any signs of intelligent
conversation. Now who's arguments are hollow?

>> Never looked under the hood? I don't think the people who's Amiga I saw
>> would have like me pulling their computer apart.
>
> Ever heard the expression "a figure of speech"??? I didn;t think so....the
> green/yellow display on the ST would have addled the mind ages ago...

Ever heard of "sarcasm"??? And by the way, my ST's screen was never green
and yellow, and although its default color was green, white, and black, you
can easily change it, and I did. You can also get many other OS's and
desktops, if you don't like TOS, many of which are very nice and
feature-packed.

>> Ok, I'll humor you once again. Yeah, look at the title of your thread.
> Does
>> "better" to you mean pure hardware specs?
>
>>> I think the fact that the Amiga was its greatest competitor and won
>>> outright, is a serious Atari topic...
>>
>
>> Yeah, maybe 10 to 15 years ago. Did you miss the memo? The war's over.
>
> Thats all I wanted to hear, ST owner...

I don't own an ST. I own a Falcon. And good, you've gotten what you wanted to hear! Will you leave now?

> And people like you carry the war on...>

Um... who's the one who came here spouting "Amiga was always better"? I never went to Amiga newsgroups and spouted the same about the Atari. You know, the more I read your posts, the more I realize, you constantly accuse us of the things you do and ignor what we say and do unless you can twist it into a lame joke.

>> Oh, is this the end? Still no real name and e-mail address, huh? Scared?
> :)
>
> Oooh I'm really scared....

Apparently. You still haven't given that info.

Well, here's my final analysis of this post:

You obviously just want to pick a fight and have no interest in discussion this topic open-mindedly and reasonably. I guess I was being overly optimistic in my hopes that I could have a rational, objective discussion with you about this subject. You are either incapable or unwilling to do so, as you refuse to acknowledge reasonable arguments, put down others left and right, and accuse them of what you yourself are doing. I guess I should have listened to those who advised not to respond to you. I just hoped you might have more maturity and common sense. You've proven over and over you do not. If you don't belive me, read your many posts. You can count the number of objective, non-abusive posts on one hand and have plenty of fingers left. You've managed to convince me that not only did I make the right choice in buying my ST and then my Falcon, but I also don't want to have anything to do with the Amiga if you are the type of person who uses them (although I'm sure most have a higher I.Q. than you). Even Amiga users are starting to disassociate themselves from you. You are an senseless, pitiable human being (if that). I refuse to post in this thread any more, as I have more productive things to do than waste my time going around in circles with fools like you. Don't bother responding. I will not read it.

Have you not figured out that you are a useless pathetic sack devoit of a human soul living a worthless existence, fighting for a cause whose members HATE you? What do you really have left besides your flawed argument? An Amiga 500? Judging by the numerous posts I've seen from you, I'm guessing that you have no life outside of the internet, and certainly have nothing better to do with the 1 1/2 braincells that rubbed together to form your original post. So there you have it, you are nothing.. Your life is worthless, believe it or not Atari users use them on purpose and are far from denial. You have nothing left.. Nobody likes you... End it now (boom)

Nuff said.

Everyone,

PLEASE! CALM DOWN! I don't want to see my thread asking for help turn into another flame war. We already got that dumbs*** Dorkling terrorizing us.

To set the records straight...I bought my copy of HDDriver from Systems For Tomorrow back in 98. (Still have the receipt!) I just never got around to sending it overseas from the US (which I admit, still makes me nervous) to upgrade. This includes upgrading NVDI 4 to 5. My handle is from my brother's fantasy baseball team - The Puffin' Puffins. Catchy, eh? So unless Puff Daddy wants to sue me for trademark infringement, I'll stick with it. :-)

I'll try the version 8.1 demo from your site and report back to this thread.

Uwe,I will email you my serial number too. And no, I didn't register it under PuffPuffin. <big grin>

-Phil

wrote:

>...upgrade memory on my Mega 1 ST?
>

You will need to open up your Mega 1 and look at the motherboard.

The first Mega 2 STs used the same motherboard as the Mega 4 STs, but
only HALF the memory chips were installed.

Atari Corp soon discovered that people were opening their machines and
adding the rest of the RAM chips to turn their Mega 2s into Mega 4s,
in complete disregard for Atari's stated memory upgrade policy, which
was "throw away your old machine and buy a new one from us".

So they redesigned the Mega 2 motherboard to eliminate the extra RAM
locations and make it more difficult to upgrade.

(They sold so few Megas you have to wonder if they ever recouped the
extra cost of the R&D to design a new board, along with the extra
costs of stocking TWO different motherboards, but that's a different
topic.)

I'm pretty sure the Mega 1 motherboard (which was designed later than
the original Mega 2/4) does NOT have any "extra" RAM locations
designed onto it, so upgrading the memory is not as simple as just
soldering more RAM chips onto it.

Also, the 1040STe was the first Atari model to use SIMMs, so the Mega1
won't use them natively.

It's virtually certain that you will have to obtain a "third party"
memory upgrade kit to expand the memory on your Mega 1 ST.

The Mega 1 was a later addition to the Atari line, and was sold mostly
in Europe, so you'll need to find an upgrade kit which specifically
states that it is suitable for use in the Mega 1.

No matter how brillant it my be, it's commercial software. In other
words, it's not legal to use it without paying for it.

I agree. I have made my point and those that do not agree should think
hard about the current state of the Atari market and that not paying for
commercial software will definitely result in the handful of programmers
that write this software *and offer support for it* leaving the scene.
If you are not willing to pay you must simply not use it. That's how the
rules are.

> I'll try the version 8.1 demo from your site and report back to this thread.

Please do so. Please also check the physical sector size your card
reader reports. Even though there are no sectors like you find them with
an ordinary hard disk drive the card reader device will report a value
for this property. It might be more than 512 bytes per sector. TOS can
only boot from media with exactly 512 bytes per sector. The sector size
is displayed in HDDRUTIL's partitioning dialog box.

In uno strano messaggio del 16 Feb 02 smeg_007@nospam.hotmail.com
(2:333/608.1) scrisse al povero All :
s> BTW, that same port is also available on the Mega STE and the Falcon
s> 030. AFAIK there wasn't any software made by atari to connect machines up
s> to a network, which is a shame as even 115k would have been quick enough
s> for networking atari's. If anyone knows of any software that can be used
..

The main reason for which there was no support for the LAN port of
TT-MSTE-Falcon is that it is not DMA-driven.

The main use for the LAN port would have been to build appletalk-like
networks, using the multipoint feature of RS422, but having no DMA transfer
ability, it would have been a pain. So it is just used as an alternative
serial port, and with little use on MSTE and TT as it was just switchable
with serial2, using the same ESCC.

Even if you expand your Amiga to infinity, this software is still amateur kid stuff, sorry. Do you even know what Cubase is?

> > I have accellerated Falcons and MSTE:s. What Amiga will spank that for my
> > purpose (audio)?
> A1200 with PCI bus board+ any pci sound card of your choice (take note A1200
> is only an 020)...

Fine, you can dope up your amiga too, but - There are no pro quality music applications worth mentioning (With the exception of Bars & Pipes, but if you have ever used it, you see why people prefer Cubase & Notator.

You don't get it here. Of course, you can put all kinds of cool hardware in your Amiga, but that is not the issue. There are no pro software of that cateory. The Amiga was for graphics, desktop video, and of course games. That was Amiga:s strength, and it did that a lot better than the ST. For MIDI and music, it is the other way around.

Btw, you said it yourself there. 020? 14mhz? no MMU? no FPU? oops...

> > Go play somewhere else. For my uses, the Amiga is extremely inferior.

Shit for brains, I have two studios, with both PC:s and Ataris in both. My stuff probably cost more than you will ever earn.

> Octamed sound studio kills all of them...
> Also, Bars and Pipes was so good that M$ bought out the comany and used the
> technology in Windoze...

(I have used Octamed myself, I know what it is. And it is _not_ pro stuff) One of my composing friends did a lot of work in Octamed before he moved to Cubase.

Bars & Pipes technology? :) Guess that's why Steinberg uses their own, MROS, then :) But you probably don't know what Steinberg or MROS is anyway.

> > My falcon has 8 x 16bit balanced audio outputs, SPDIF, high quality
> external
> > A/D converters etc.

> My A1200 with a Soundblaster Live has SPDIF and digitail optical I/O...and
> thats comparing a theoretically weaker Amiga to the Falcon...

While the SBLive has a lot of horsepower, being based on the EMU10k chip, the D/A converters are poor consumer qualitiy stuff. The S/N ratio of the SBLIVE is somewhere around 70db. If I remember correctly, this is equal to a resolution of somewhere around 13bits. I know the SBLive is supposed to do 16 bits, but Creative screwed up the hardware and used poor quality op amps and D/A:s...
Compared to my falcon, 96db S/N ratio, balanced outputs, well...

Tip: Use it's bigger brother EMU-APS instead. That is pro stuff. I use a couple of those in my PC:s, btw. The last time I checked these cost like 7000skr, about 700$.

> YOu must be a shite programmer....HOw come programmers of Octamed managed
to
> get 8 channels of sound out of the AMiga?? Just shows your lame
programming
> skills...

Brainless, the HARDWARE only has 4 channels. By combining 2 channels at fixed frequency per channel, and lowering the resolution by 1 to prevent distortion. I know how. Then you have 7 bits, 8 channes, 29khz, but hey, you say that this is pro quality.

> this would have worked in some other ISO-8859-x variant?

OElig appeared in ISO-8859-15 (Latin9 a.k.a. Euro-enhenced Latin1), while
AElig exists in ISO-8859-1 (Latin1) and several other encodings.

Of course, the best long-term solution would be to switch to ISO-10646
(Unicode), which separates locale setting from display fonts.

Unicode offers support for every human language's glyph and then some, by
design, including some ancient but historically significant alphabets. Of
course, proper Unicode supports is also dependant upon the OS's fonts and
whether they include a desired character from a specific range e.g. if the
Cyrillic range of the full encoding is not covered by the installed font,
then the text will not dislay as intended.

Using the default Atari system font as a starting point, it should already
be possible for Internet client authors to include partial Unicode (UTF-8)
support into their software, by at least converting to/from characters
already present in the TOS system font.

1388. Calamus for sale

Newsgroup: comp.sys.atari.st
Date: 2002-02-17 10:36:11 UTC
From: d.e.cohen@qmul.nospam.ac.please.uk.invalid
Message-ID: <1f7qvvv.btvlofp6phvkN%d.e.cohen@qmul.nospam.ac.please.uk.invalid>
Source record: 37842

I am still wanting to sell my copy of Calamus SL if I can get a good price.

It is Calamus SL 95, which is a bit ancient, but still very usable.

Also, if anyone wants the latest version, Calamus 2002 (which runs both on powerful TOS machines such as Falcon or Milan and on PCs - also on Macs with MagicMac), buying SL95 from me will entitle the buyer to a *huge* reduction in the price of 2002 (2002 new is something like 700 euros, with the upgrade only 200 euros). I have confirmed from the distributors of Calamus that I can transfer my registration of 95 so that the buyer is entitled to upgrade to 2002.

> Norwegian/Danish/Swedish AA ("Å" in HTML) = ï¿½
>
>
> (I'm using MacSOUP on the Apple Mac, and it should be using the ISO
> 8859/1 character set as far as I know).

Kenneth probably meant:

œ in HTML.
Œ in HTML.

ISO-8859-15 (Latin9) introduces, besides the Euro, several other
characters needed by major European and Scandinavian languages:

Euro
oe ligature
OE ligature
s caron
S caron
z caron
Z caron
Y acute

Essentially, Latin9 replaces Latin1's spare accents and the universal
currency sign by these glyphs.

OElig and Yacute were requested by France and Scaron and Zcaron by Finland
(as far as I can remember). I don't remember why French needs the former.

Finnish needs the later because gramatical rules state an ortograph based
upon one sound per letter, which creates problems when translating Russian
or other Slavic words (Russian has 7 sibilant consonnants), because there
are no equivalents letters for ze, zhe, tse, tche, sha, scha. The solution
found by Finnish gramaticians was to mandate the usage of the caron accent
used in several Central European Slavic languages, when transliterating
Slavic words to Finnish. This decision is documented in standard SFS 4900.

***

Btw, there is a Latin9 equivalent meant for Central/Eastern Europe:

ISO-8859-16 (Latin10)

Along similar lines to Latin9, this one is essentially ISO-8859-2, plus
the Euro. It also improves support for some latin-based East European
languages, at the expense of a few others.

Exactly. I simply found it interesting to check how Okami would be able to deal with ï¿œ and ï¿œ (I'm in ISO-8859-15 now). How the conversion to and from Atari ASCII etc would work.

The result is that most is fine. If I have set Okami to use ISO-8859-1 as default any incoming messages in another charcter set will disply correct according to the settings in the header.

On the downside, if I reply to a post in ISO-8859-15 Okami will still encode my answer with my default charcter set which is ISO-8859-1. If there where any ï¿œ or ï¿œ in the quoted text they would still look allright while I'm in the external editor but later show up as 1/2 and 1/4 in Okami itself. On the other hand most newsreaders don't understand ISO-8859-15 anyway so the benefits would be marginal...

I've always wondered (for a couple of years, that is...) why Finnish would need any special characters not present in ISO-8859-1. Usually in older printers etc Finnish and Swedish uses the same character set but this explains why you posted here in ISO-8859-15 some time ago :-)

Also the new shareware (50 Euro) version Calamus 2002 Light is now
available in English from the Inverse website for download. You get a
free 30 days trial. I'm working with it now on a 36 MB RAM TT and it
runs really well. It's nice to have a major application like this with a
release date of february 2002 on a dead platform :-)

Calamus in now really multiplatform as the very same code runs (by
emulation) on Ataris, PC's and Mac's. I'm considering ordering the full
2002 upgrade so the above deal is recommended.

Did you ever try the RAM card in another TT? One of my TT's is rock solid (runs my webserver) with only 4 MB ST RAM. If I put in a genuine Atari 4 MB TT RAM card it sort of works with TOS-Geneva but fails to boot with Magic if it is not completly cold. In Geneva most programs work except some written in GFA where strange things start to happen (file not found etc.). Also Cubase fails completely.

I used this computer (with the TT RAM) for over a year for most of my Internet activity using CAB, Okami etc without instability under Geneva. So obviously some programs like Magic, Cubase, etc simply puts the hardware to the edge.

If I put this card in another TT everything is OK. Both TT's are of the same older type with metal shielding etc.

If you do what I used to do quite often, i.e forget to plug a mouse in and boot to gem, then use ALT with the arrows to move the mouse cursor, eventually you will hit the help key with ALT pressed which will try to dump the screen to the printer. When there is no printer attached, the machine apparently locks up with no error message and you have to wait 30 seconds for it to come back.

Yes its a bit of a PITA.

I've had one (aixit) in my TT since 1990 something, forget what year, it's been that long. Works perfectly. Just need an ethernet solution as reliable, as the TT is now the only machine not on my LAN atm. ;-)

No. The *first* three things done are:
- disable interrupts by loading 0x2700 in sr
- reset the external peripherals, using the reset instruction
- check if a diagnostic cartridge is in place and if so, jump in

the reset vector is checked later, after the memory has been
configured, (but it is true that 'ordinary' cartridges are tested
after the reset vector).

Laurent.

Hi!

How can I make XaAES work together with my screenblaster? When trying it with the fvideo-option the falcon reboots immidiatly after selecting the resolution with the SB-Software..

Bye,
Matthias

God, it's good to think about this stuff again after so long! And
after the reset vector, the memory was scanned to see if there were
any magic reset-proof programs in memory... or did that happen AFTER
the floppy bootsector. Yup, it did, or those viruses wouldn't have
worked.

Since I got my emulator up and running I've just been itching to write
some 68000, but I have to be rather more constructive right now..
looking for work!

| > Its a TOS bug, never caused any harm so it doesn't get mentioned.
| >
| > My MegaSTE doesn't do it.
|
| How come? Which TOS version is it?
| I have TOS 2.06 in an STe and a Mega STe myself. Haven't had the Mega
| STe for long enough to use it extensively, but know for a fact that on
| the STe (also with TOS 2.06) the timeout seems forever.
|
| Is there something else in the Mega STe which prevents this from
| happening, or are you using an entirely different (or patched) OS from
| me?

My TOS has been heavily modified, its the PAK custom 32bit 3.06, some stuff
heavily modified, some other stuff missing altogether.

>broken trace, both on the motherboard.

Maybe, but to me it sounds more like some sort of timing problem or
something?

Intereresting was that some compiled GFA programs I have written myself
worked perfect. Another GFA bookkeeping program (Bokfï¿½ring 3 by Bo Leuf
for Swedish readers) however failed to find certain files and tended to
crasch. Also the GFA 3.6 interpreter did not run at all. On the other TT
all was fine.

There was no general memory corruption that I know of. No textfiles got
misspelled and QED was set to allocate in TT RAM, etc.

P.S. Your unortodox citation mark (ï¿½) ruins my nice multicolour display
with different colours depending on the numbers of > signs at the
beginning of the line. I have already put in | as an alternative but your
ï¿½ signs are afaik unique... On the other hand your name comes up
correctly here but you will not be able to see it yourself with Newsie.

I have been running the Genius LAN pocket adaptor (now sold out) with the special cartridge adaptor now for over a year on a 24 H a day basis. So far not a single dropped packet using STinG, so this is really a very solid solution. There has been quite a lot of traffic here at times. When the Windows IIS trojan NIMDA peaked I got a couple of thousands requsts a day without problems.

1404. Stacy Power Converter

Newsgroup: comp.sys.atari.st
Date: 2002-02-17 20:32:54 UTC
From: bwiltshire@cableinet.co.uk
Message-ID: <3c72131f.11802652@news-east.giganews.com>
Source record: 37757

After some methodical threading of cables thro hinge pivots etc I have managed to disassemble my Stacy 2 and fit a 240mb Seagate HD. I have removed the 68000 and put a socket in there. With some shield hacking I have got a nice T28 accelerator to fit a treat. One snag. Every thing works great until the need to use a floppy. Unexpectedly the HD must be taking more power than the (older) 20mb standard drive The internal power converter then decides that it has had enough and shuts down briefly causing a reboot. There seem to be a few Stacy experts here. Anyone know how to modify said converter to provide just that bit more ooomph please?

Dear Atari users,

I am pleased to inform you that MyAtari magazine has just added a new article (The MultiJoy8 Interface by Harry Reminder) to its February 2002 issue! The other exciting news is, next month, MyAtari will be holding its first annual awards. However, before voting begins in March, we want you to send us your nominations for the following categories;

Best Atari web site of the year
Best Programmer of the year
Best Commercial release of the year
Best Shareware release of the year
Best PD/Freeware release of the year
Best Game release of the year
Best Hardware upgrade of the year
Best Atari supporting company of the year
Best Atari magazine of the year
Outstanding contribution to the Atari community

To read the latest issue or submit your nominations, please visit our web site at http://www.myatari.net

Best Regards,

Matthew Bacon, Editor

What happens if you first park the harddisk and then access the floppy?
Does it still reboot?

I suspect that all would then be well as simply putting the standard
68000 back in thereby reducing the power requirement sets everything
working ok.
Parking the HD is not something that I can see that can be
done easily. Not with the drive running on ICD Pro software anyway.
Unless you know better?
Thanks
Beedub

> alternative MIDI hardware for the ST (if you need multiple ports, etc.), so
> the Amiga's not alone in this.

To get alternative ahrdware for the ST is a joke....what expansion ports do you have?? Only a SHIT THING would be designed such that you have to break the machine open and resolder the damned motherboard, what a stupid way to upgrade a machine....Like I said, the ST is designed in a stupid way, its just a game machine...

>
> Yet again, you prove you know nothing about MIDI. It has nothing to do with

Yes, but MIDI comes under the category of sound, since MIDI is used for SOUND purposes...

Whatever.
You can't accept the fact that Atari matured into a better machine out of the box. Apparently you lack the skill to research and read specs and ignore most facts. Be that as it may the current situation seems even worse since there are 2 complete motherboard designs for the Atari with integrated PCI slots (4 to be exact). So what if they are 3rd party, so are all the upgrades for the amigo. So if you do the homework on the PCI specs, you'll find it out performs the age old zorro bus. So by your logic Atari is still better even today. Atari is and will always be a better over all machine, and it still is, I don't see amigo clones with integrated pci slots. Not to mention a complete lack of understanding when it comes to midi and how it works.

I don't mind heathly debate, but you don't understand that either. Reply all you want I'm also done with this particular thread. One cannot have a discussion if the other end can't listen to one word. Please note I didn't toss around insults in my posts. Denial can lead to serious health problems, perhaps you should seek professional help ASAP. I'm serious.

Have a nice fantasy...

>though. Shame, you were almost entertaining. <grin>

Troll?

I am not here to entertain you four-eyed gimps....I merely browse this group
occasionaly for the sheer entertainment of seeing dickheads arguing that the
Amiga is a viable platform; when in fact its long dead...

>
>Um, so yeah, I have an emulated Amiga .. you're next posting indicates
>that you most likely have an emulated Amiga too. (Either that, or you
>have all these 'ROMs' and haven't yet worked out what to do with them.)

Yeah I have an emulated Amiga, on a ***WINDOWS*** machine (AMiga owners stick your heads up your arse), and an athlon, and it runs an emulated amiga
faster that your actual A4000...

>
>Also I have a nice wee a4000 .. which I gotta admit is damn useful.

>Coz you gotta admit, the software emulators still aren't quite there
>compatibility wise.
>So are these regurgitation fits merely because u
>realise that you can't run everything we can? Does it hurt that much?

hahaha You sad worthless geek...Do you really think I give a fuck
whether or
not my emulation compatibility isn't as good as an A4000??? I just use
it to
play games, which is all the AMiga was ever good for....What do I care
whether or not I can emulate an A4000??? Its now a piece of junk
anyway....Its been overtaken by newer hard/software....

Regurgitation fits??? Over not being able to run shite A4000 software???

PLEASE STOP, you are killing me, this is just too funny....

Er, no it doesn't hurt that much....In fact it doesn't hurt at all...Oh,
and
what shite software are you talking about? WHy would I want to run
everything you can when an Athlon and WIndows can give me almost any
software I want, faster and better than the old AMiga....

>
>Poor boy. You need some friends. ..You need to work on that.

Gee thanks for the advice!! Thats exactly what I need!

Grow up and move out of your parents basement....The A4000 is obsolete,
just
accept it.....

From: chris.crosskey@vicon.com
Message-ID: <97a8a4d8.0202180053.556bbf5a@posting.google.com>
Source record: 37778

Hi Folks...

I've got a big problem setting up a Protar Progate R44 cartridge drive (it's a Syquest SQ55) with a TOS2.06 STe. When I first set it up it was with a TOS1.62 STe adn it was fine, the supplied software (v4.02) worked fine, and it was a doddle to get the whole thing up and running as an auto-booting hard-drive. I really need to get it working on a friends TOS2.06 machine, she doesn't really want to go back to 1.62 cos she's got used to the 2.06 desktop shortcuts etc....Whatever I do it seems to corrupt the cartridges if I write data to it under 2.06....I've tried different floppy drives, I even tried putting in different TOS ROM's and I've also tried HD-Driver 6 and 7....It's always the same...if I'm in TOS2.06 it'l;l corrupt the whole partition if try to write to it, if it's 1.62 it's fine.....any ideas?....is it a switch I'm missing somewhere?

The same problem happened to me and, as such, my Stacy is currently dead.

The small print should have read:

Beware of power-hungry hard-disks, they will blow up the 12v part
of your power regulator board, forcing you to resort to floppies.

I already figured out what parts I need to make a new 12v regulator board.
The parts count is so small, I could build it on a piece of perforated
prototyping phenolic board and house the circuit under the battery hatch.

I guess it's yet another TO-DO on my list...

Your problem looks mainly like a size trouble.
Atari TOS releases can?t handle all the same partition sizes.

Please have a look: (DOITF030 article 19.2 / DOITST article 21.2)

Tabelle 56: Atari Partition Sizes
TOS-Release Size / Gr?sse Comment / Kommentar
TOS 1.00 - 1.02 256
MByte
TOS 1.04 - 3.xx 512 Mbyte
TOS 4.0x 1024 MByte
MagiC 1024
MByte
BigDOS 1024 MByte
MagiC / BigDOS 2048 MByte (DOS-Kompatibel)
MagiC
6.1 -> FAT32 -> Terrabyte (nicht MagiC 6.01)
FreeMiNT 1.15 FAT 16 2048
MByte (DOS/TOS komp. Partitionierung)FreeMiNT FAT 32 !> Terrabyte

Hope that helps :)

I have the same problem with ScreenBlaster II (external) and XaAES. It just
hangs up when XaAES should start.
But without XaAES, MiNT works perfectly - never had any problems with it.

Yes. If I had an internal Screenblaster that would be my choice, too.
But I do NOT think that Videlity can use the external Screenblaster
hardware!

Have you tried this? Set clock to "external" in Videlity, and see what
happens. My guess is that it works, unless the external Screenblaster has
some control lines from a joystick port or something like that (I don't
know, I've never seen one).

I can't see it being partition size related, the boot partition is only
5Mb, the other two are 19.5 and 17.5Mb respectively and are being picked
up happily with any software I use under TOS1.62. Under TOS2.06 the
whole partition corrupts (any of them) as soon as I write any data to
it, be it direct from the desktop or from within a program.

Here Duckling can you explain to all these "poor st users" what exactly midi is? Personally I don't think you can and so your arguments have all been in vain.

1441. Calamus in 16-bit?

Newsgroup: comp.sys.atari.st
Date: 2002-02-18 16:27:21 UTC
From: jba4@po.cwru.edu
Message-ID: <3c712a4b.298954276@news.cwru.edu>
Source record: 37794

Hey everyone! I've been extremely happy with my Galaxy grpahics card from Mario Becroft lately. It has worked like a charm. The only thing that I've been a little down about is not being able to use Calamus SL. The Galaxy uses 16-bit color only (only) through fVDI, although a monochrome driver for the Galaxy exists. I hate having to swtich to monochrome and, therefore, I have not been able to use Calamus for a long while. Mario has explained to me that Calamus has some real problems deep within its code with trying to operate in 16-bit color. I was wondering if there exists any other solution other than siwtching to a different color depth. Is there any software (or wiould it be possible ot create any software) that could fool Calamus into thinking the screen was monochrome or perhaps 256 color? I know it's not quite as simple as that, but oculdn't a driver be written that could be run before Calamus so that when calamus is run, it can only see two colors out of the whole pallete and perhaps work with fVDI in 16-bit color mode? Just a thought! Anyone have any suggestions?

Frankly, you are so lost. If you have ever used these programs you would
know what we are talking about. The midi functionality of Cubase 3.10 on the
ST is identical to the midi functionality of Cubase VST32 5.0. The
difference is the Audiopart.
But as you say, Cubase is not for pros..
Even if you think Cubase is kid stuff, how about Logic Audio?

Guess this is why every musician in the world used the great Amiga, because
everything else was crap, right?

> Cubase is an amateur sound program...SOmething better is the Amiga's
Octamed
> Sound Studio Pro or Bars and Pipes...

Yeah, I agree. 7 bit sound is a lot better than 16 bit. Also, Octamed with its timing resolution of something like 50 pulses per quarter note so great. Also, Bars and Pipes feature "thou shalt not be able to change the midichannel of a track" is one of the best in history.

> > > > I have accellerated Falcons and MSTE:s. What Amiga will spank that

> The Amiga was better full stop, even in midi, with midi expansion, which
was
> better hat the ST default port...

I guess in your world there is no midi expansions for the Atari range. But
in mine there sure is.

And btw, I have an ISA interface on my MegaSTE, it is a bridgeboard for the
VME bus in it. But as you said, VME busses cant be used for expansion.
Neither can the cardridge port. And yeah, the direct CPU slot on the Falcon
cannot be used for expansions either. And the MegaBUS on the MegaST cant etc
etc etc

I'll hurry and buy some more Amigas so I can get all those wonderful
expansion kits, and move away from this stupid world of so called
"pro-equipment". Now I know what "pro" means. Yeah. I'll buy an Amiga, a 24
bit soundcard with a kick ass DSP, and use some REAL pro software, not like
the ones on my Falcon nooohoo I'll use Octamed!
Not like amateur stuff like the "industry standard" Cubase or Logic. That is
just shite.
Yeah. I'll do that tomorrow.

You won! Thankyou for showing is the way! How could we all have been so
stupid!
Again, Thankyou.

> Can an ISA backplane take a 68000 CPU?? NO it can't...so stupid example,
> again...from an ST user...

Well, besides address decoding, you need the following, if I remember
correctly.

The 68000 has no A0 like the ISA bus, but this can be fixed using some logic
and the DS1/DS0 signals. DS1 connects to the SBHE in the ISA bus.
For BALE, you can often use AS. For timing reasons, some boards requires
BALE to be in better sync with DS1/DS0, but this can also be done with a
couple of gates.
To enable the use of I/O R/W and MEMR/MEMW/SMEMR/SMEMW, some address
decoding is needed, to put the I/O access in another memoryarea.
A 14.xxx mhz oscillator
8 mhz clock.

But as you said, I don't know shit.

Does Calamus work in 24bit colour?
In this case, it should be possible to make a "24 bit emulation" driver,
where the screen memory is 24 bits but the physical colourdepth remains
16bit.. But this would eat lots of memory and probably be dead slow too.

/Peter

Hello all,

Has anyone sucessfully installed this. I am ready to do so myself, but I have some questions. What OS do you have to be in when you do the install? Also, the program requires the file tree to be in a certain order when the rpm packets are installed. I was wondering, does the program ask which rpm packet to install next? If not, how do you arrange the lising so the whole thing installs properly?

No, the latest version only works in 32-bit for color. I do believe it
also work in mono. Maybe that will change in the next update. The
program loads in 24-bit, but the color output looks strange.

You cannot change resolution while XaAES is running.
I dont know anything about screen blaster.
Can you find a way to set the resolution before starting XaAES?

You can always start up in ROM tos in the resolution you want and then
simply start XaAES from the desktop without parameter.

Hi Chris!

The sizes aren't a problem - but neither is the use of the
SyQuest 44 with any TOS since *all* will handle 44 MB. I can
suggest two possibilities: Perhaps the SyQuest is not partitioned
AHDI-compatible: Try repartitioning it with HDDriver if you can
afford to lose the data (perhaps with another cart).

ISTR that there is a difference in the boot and/or root sector
with AHDI- and non-AHDI-copmpatible partitioning. This is what
could cause the corruption, though I would have expected it not to
depend on the TOS.

The other posibility is that there is something wrong with the
connection/termination. Have you used *exactly* the same setup with
TOS 1.62 and 2.06? The same lead, terminator etc? Or is your TOS
switchable so that you are using the same setup? And do other hard
drives work OK? It could be the Protar host adapter is not compatible
with the later TOS. Have you triesd another host adapter to SCSI? (All
SyQuests are basically SCSI devices, so need a Link or other HA).

Regards, /Peter/

1467. MiNTnet OVL w/SSL

Newsgroup: comp.sys.atari.st

Message-ID: <Ywgc8.8349$Se.3719242@typhoon1.we.ipsvc.net>
Source record: 37720

I have just finished rewriting the low-level math routines in OpenSSL 0.9.6c in assembly language. The SSL library with these routines is now 5 times faster than the previous version. You can grab just the cabssl.ovl binary from my web site at http://www.highlandsun.com/hyc/cabssl.ovl.gz or you can pick up the entire package if you need it. Note that this is still for 68020 and up. So far no one has asked for a 68000 version. With this library I can now get a secure login to my.yahoo.com in only a few seconds, instead of taking so long the Yahoo web server disconnects halfway through... (On my TT030.)

memory fades, but i think that the 1772 floppy controller is looking
for a certain number of index pulses from the drive before it shuts it
down. depending on the model of disk drive you've got, the index
pulses aren't reported unless a floppy is in the drive

i don't remember why the desktop shuts the drive down. it probably
just borks the power or something

Hello Dorkling,

Hey everyone, Dorkling reads this newsgroup at home and at work. Wow,
this guy needs to learn how to talk to girls so he has something else
to do with his free time instead of spending it reading a newsgroup
for a computer he claims to hate. What a loser.

Dorkling, you said you didn't use the Amiga to read this newsgroup
because you were at work. Well, your at home and still not using it.
Try reading the Amiga newsgroup. I bet they can help you connect a
modem to your Amiga and get it connected to the net.

Please take your time with a reply so you don't sound stupid like in
your other postings.

The installation is really simple. You just start the program and go for a
walk ;-)
First you have to make few basic things manualy (like selecting the
partition to be ext2 or giving the path to naes or xaaes etc.).
Then EasyMiNT installs MiNT (kernel + MINT folder) and resets the computer.
The rest is going under MiNT. You don't have to unpack anything. EasyMiNT
makes everything for you :-)

You could run TOS 2.06 on an emulator under windows (eg STEEM) and do a
ALT+Prt Sc screen copy, the image would be in bitmap but you should be able
to convert it if necessary. If you don't have an emulator let me know and I
could do one for you.

Wow, sounds great ! ATM I have KGMD plus a few updates running (only
package I could install without any problems) but on that system I
never
succeeded in installing any of the rpm archives. Probably some parameter
not set or set wrong in mint config or somewhere else, really have no
idea.
So if EasyMiNT installation would enable me to finally use the sparemint
archives the only (dumb ?) question before I try installing it is
where
can I download it ?

Gerhard

IIRC, <SHIFT> and <ESC> force a media change, (i.e. the media will be read
even if it has not been changed) then do the same as <ESC>
I am not sure this existed in TOS 2.06

>I think he had a problem with that site - he changed job or something

The site was up for almost a year and a half after I left, but a few
months ago the room the machine in question was standing in was
apparently needed for something else...

To make matters worse, I've not been able to access the machine for
quite a while and have no backup of the Web/ftp site. I think I've
convinced the sysadmin to make the machine temporarily available to
me in the not too distant future, though.

>Try this instead: http://www.vianet.ca/~joshua/ - it's the 'official'

Or the same place via http://eclipse.atari.org

I expect to get a Web site up and running again soon, but for the time
being I usually have an ftp server running on my machine at home.
You'll always find the very latest fVDI software there.
No decent domain name yet, so go directly to 194.236.123.228

Calamus also works in 256 colour mode (on a Falcon at least), one must run
the Falcon screen driver that comes with it first, and set the line:

NoTransparencies = On

In the system parameters section of the calamus.set file.

That cures a lot of the display problems in the working window, however the
colour wheel will not display correctly in any case.

Yeah, when reading a text file that you double clicked, you can press
<space> to go forward a page, <D> to scroll HALF a page and <Q> to exit.
These commands are also available in Tos 1.6 and I think Tos 1.4 too. There
are other commands while reading text but I cant remember what they are.
(maybe P will print and I think there might be a key to scroll up).

You use ordinary 3.5" disks. You need to get 720k (DD) disks (only one hole in them instead of two). You could of course fit a HD floppy to the STE if you are good with a soldering iron (I think you have to replace the FD controller chip or something) so you can write HD disks - any games you have on DD would also work, but if you want to create some disks from disk images off the internet then you will need some DD disks anyway. I think www.1632systems.co.uk has some (if youre in the UK) - I bought a box off them a few months ago.

Funny, this works on my STE (1.6) and Falcon, but never on my Mega STE. I thought it might be something to do with the German Tos/Keyboard but I doubt it.

1489. XAAES941 & JINNEE

Newsgroup: comp.sys.atari.st

I have try XAAES41 on my Falcon and the debug version doesn't want to work at all (pid 1 system crash). I have try the version whithout debug whithout any problems. All the older version work perfectly. I want to install jinnee2.5 demo whith XAAES941 but I've got a memory violation when i launch if from xaaes941.
I haven't got any problems with THING !
I have already install WDIALOG whith JINNEE and the 941 version of XAAES seems to correct the bug at the launch of jinnee.

How do you launch jinnee from xaaes941 ??? (I have try shell jinnee + jinnee.app)
What is the bug with the debug version ??

Thanks !

I've don that , different carts, the same carts, HD-Drive v4,6 adn 7,
AHDI v4 and 6, CBHD....it's all the same....I'm beginning to think it's
the TOS installation, but I've tried two sets of ROM's.....The jumpers
are OK (you move the pair near the TOS ROM's and the other one stays in
the same place yeah, think they're W101, 102 (moved) and 103 (stays)...

Exactly the same, same machine everything...if I put the 1.62 ROM's back
in everything is fine....
I'll try a spare Syquest 88 if I get the chance, but this is a customers
machine so time is of the essence....I think I'll have to replace her
STe motherboard and leave her one for TOS1.6 only duties....

Ok, sounds simple enough. Then I could start under regular TOS and go
from there. Why does the program reset the computer? Does it do this to
start up Mint and then finish the installation?

1504. Emulators and non-game software?

Newsgroup: comp.sys.atari.st
Date: 2002-02-20 02:34:28 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B89859A6.1E6E8%nameerf@flash.net>
Source record: 37653

Hello!

I think I posted this once before (quite a while ago), but I don't know where any of the replies went, so I'll ask again...

I would like to try using ST emulators (specifically NoSTalgia or PowerST) to run some software on my iMac that runs too slow on my Falcon at this point. Is the following possible, and how is it done?

1. Accessing a folder or other part of the iMac's hard drive from the emulator so that I don't have to create *.st disk images of everything.

2. Using the iMac's higher color/resolution modes instead of the ST High, Medium, and Low modes.

3. Using either Mint and an AES, or Magic for multitasking.

4. Using the iMac's fonts and printer drivers to print from the emulator.

5. Using the iMac's modem with STiNG.

I know that MagicMac with NVDI will do all this (except the Mint and AES part), but I don't think I'd do enough with this to warrant the cost. If it does turn out to be more useful than I think, I would probably do that though. Thanks for the info!

I messed around with these, but without registering them you can't fully explore just how well they work. So I cannot even comment really.

I have a full magicmac install, but I found I don't use it. All my Atari's are decked out in full MiNT-Net/N.aes setups and magic just ain't doing it for me. What you need is 'aranym' ported to the mac. If you have different goals than me and it sounds as if you do, then magicmac maybe your answer.

The STF and STFM are able to do video out, but only for low and medium
resolution. I've used it briefly, and the results are O.K., but
nothing special. If you just need ST High, I'd recommend a 9" VGA
monitor. They are available for around $150. Try
http://www.outsrc-em.com/rack-products.html for an example. Note that
smaller monitors exist, but the cost goes up significantly. A small
monitor does not have the luxury of scale of manufacturing that the
15" ones do. Alternatively, a 12" LCD monitor might be locatable for
around the same money.

> unit?
I've never used one (or seen one), but the Janus is a hardware ST
emulator. The primary con is that speed is fixed, since it is
hardware. There really aren't any pros compared to software only
emulation unless you are on a very old computer.

> internal batteries or anything.
If you look closely, there is a five prong adapter visible on the main
board from the battery compartment. However, a battery small enough
to fit in this compartment will not provide much charge. Use a power
cord with the correct end to plug into the STacy on one side and
alligator clips to grab the battery's terminals on the other.
>

> was simply put in a parallel circuit?
Yes, it will work, but the low power LED may light. Please note that
DC voltage does not remain constant in a battery, so a 12V battery may
provide anywhere from 10 - 13V depending on its state of charge. The
low power indicator appears to be merely a voltage 'idiot' light, and
circuitry in the STacy automatically shuts it off when the voltage
gets too low. (Of course, then the battery rebounds, voltage raises,
and the Stacy turns on again, which drops voltage again. It's not
good to boot your Stacy 30 times in 5 minutes!)

Agreed. If I hadn't just paid $350 for a used Falcon and another $350
for a CT60 I would have gladly bought his computer. Boy does my
Falcon need a video card...

From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0202192110.c15c820@posting.google.com>
Source record: 37661

Hello everyone,

Twice on my Mac Quadra I've downloaded the 6.1.5 and 6.2 patches from ASH, and twice Stuffit has declared them corrupted. Since my download the same day of iCAB worked fine, I don't think the problem is on my end. Does anyone have these patches, or am I stuck using 6.1.4?

Galen

Yes :-)
EasyMiNT has to install many things on the ext2 partition and under regular TOS
it's impossible.

In this case it might be that the device requires initiator
identification. (Did you enable this in HDDRIVER/HDDRUTIL?) If this is
the case (like with some Quantum hard disk drives) TOS is not able to
boot from it.

1516. Phoenix II?

Newsgroup: comp.sys.atari.st
Date: 2002-02-20 10:50:14 UTC
From: John Perez <jhperez@uhunix1.its.hawaii.edu>
Message-ID: <a4vv16$6b6$1@news.hawaii.edu>
Source record: 37668

Greetings,

Anyone out there that has Phoenix II? I have it, although my manual is in a storage facility. That's right, if you remember, you can't use Phoenix without TYPING A WORD IN FROM THE MANUAL! Sheesh. I do have a version of Phoenix that doesn't require this nonsense, although it is the 882 version - I'm trying to run this in emulation to see what kind of rendering performance that I can get, but the 882 is not supported.

So, does anyone have the versions of Phoenix II that do not require the copy protection check? Please help!

I promise, I own multiple copies of Phoenix/Xenomorph 1-II. I have hundreds of pounds (in weight!) worth of legitimate Atari software and am not requesting anything improper.

Please respond here or send me an email.

Thanks!

John Perez

1517. Atari Mega 1 NT specifications

Hi, I live next to a secondhand shop and they have an Atari Mega 1 NT (that is wat the label says)
Can someone tell me the specifications or point me to a site with the specifications?

I like to know the CPU + cpu speed, amount of RAM. video specs like resolution, colors etc. and audio specs.

I can buy this Atari for ?15 (about US$13)

Thanks in advance,
Randy Wintjes

You'll end up pulling your hair out trying to use it on anything but
the most basic 3D2 or DXF files.

Was hoping that Tom Hudson picked up on the thread put up about TOS
users needing a modern CAD file import/export utility.

Francis Lacoat's software package is much better for file conversion.

Calamus SL 2000 or newer runs only in 256 and true color. I must say
true color doesn't work so good on my Hades. I get lots of strange
things in my Calamus docs. Maybe it's a setup problem on my side, I just
don't know and frankly I don't bother very much as I don't use true
color very much. With 256 colours Calamus works fine. NoTransparencies
is set to off on my setup.
Anyway the colour wheel does show my the right colours in both cases.
Which version of Calamus do you use? I've tried both SL2000 and SL2002.
With both the colour wheel does display correctly. I have heard from a
MagiCMac user he had the colour wheel too but only with SL2000. With
SL2002 things shows up correctly.
But again on my G3 running magicMac both versions works just fine.

CU,
Martin

Not strictly relevant to this thread but I think it is a pity that Calamus is so clumsy to use. All this malarky about colours, and fonts being tied to your number, and the text editor, and having to put styles in lists before using them, and documents not being suitable for a particular version. (Maybe they have given the latter up?) I now prefer to use Papyrus if I can.

If it was throughly overhauled and given a human-friendly interface it might get somewhere.

1528. Advice re- dat or cd recorder?

Newsgroup: comp.sys.atari.st
Date: 2002-02-20 20:09:04 UTC
From: wmartz@firstpresdalton.org
Message-ID: <2f399fc7.0202201209.5d198f11@posting.google.com>
Source record: 37681

I have 2 falcons, CAF, a fad-8, cd recorder. When I bought my second falcon, it came with a FDI. For some time I've been doing mixdowns of midi recorded from the synths and audio internally in CAF, and I know that the best audio quality is probably to be had that way as it involves no further passing through AD converters. On the other hand, it would be convienient to do a one time mixdown to another device, and would let me use external effects devices, ect, with complete flexability. So I've considered looking for a second hand dat machine to use with the fdi, but since dedicated CDrecorders are coming down to comparable prices, I've been wondering if they would be in any way better than a DAT-FDI setup, or can some of them even be used with an FDI? Any advice/opinions would be welcome! Thanks!

�I need one to upgrade my "early" Mega STE.

Well, an Ajax is only a 16 Mhz wd1772.

There are wd1772that support 16 Mhz, other don't. I was told that s�ries 02 only support that speed, but I owned an old wd1772 that runs at 16 Mhz (yep, it was a bit warm and I put a radiator, but it worked).

So I have only one advice : try 16 Mhz with yours.

Regards

>know, the one you used to open to turn your DD floppies into HD.... ;-)

Well, you're right : closing the HD hole allow you to use HD discs on DD drives
but HD are not as reliable as good brand DD.
I have 1985 DD that are about fine but I never got HD that can pass 10 years
without defects. Maybe it's only the HD of that time that were a bit weird.

>But I really wish we could use HD floppies on a ste ; I heard it could be done,

Definately yes.

>a couple of graphic cards.

So far only two types of ATI RageII cards are supported by fVDI, and
the driver currently only works with the Eclipse PCI bridge board for
the Falcon. The driver nearly starts up on a Milan now, however, and a
kind soul has promised to let me borrow a Milan board, so I'd expect
to get it working on the Milan within the not too distant future (I'm
not sure when I'll receive that Milan board or when I'll find the time).
Hopefully, the RageII driver will start working on the Hades when it
does on the Milan.

I have a whole bunch of PCI graphics cards (8 or so) I'd like to write
drivers for, but it's not likely I'll ever get around to doing all
those drivers by myself. I'd be happy to help out if someone else wants
to give it a shot, though. I've already done that with the fVDI
drivers for the Galaxy graphics card and for the ARAnyM emulator (in
the latter case, the fVDI driver enables the use of any resolution in
8/16/32 bit mode, using the SDL library (it's very fast too)).

>Optimistic point of view : the productor of VODOO cards is more intelligent than

Was more intelligent (or at least nice). 3Dfx ceased to exist a year
or so ago. Of course, it's still possible to find used Voodoo cards
(and even new in some places), and at quite reasonable prices.

>other and give infos for all his cards, but till now nobody ever made a driver

I started working on that quite some time ago, but ran into trouble
trying to read the ROM on the card (setting up graphics modes is a
major problem with writing a driver for a PCI card, and there is
supposed to be tables in the ROM for that on the 3Dfx cards).

The problems are gone now, but I've not yet gotten back to writing
that driver, unfortunately. I have a Voodoo Banshee and a Voodoo 3/2000
here, so those are the cards the driver will be tested on (in case
anyone wants to get hold of one already ;-).

>for one of those great cards. Maybe it's too much difficult ? Remember that all

Not really.
Without acceleration support, it's dead simple to write an fVDI driver
once you have the graphics mode set up. Shouldn't take more than an
afternoon or so (but it will be slow, of course).
I don't expect the basic 2D acceleration features to be very hard to
use on any PCI card either. The RageII, Voodoo and S3 Virge cards are
certainly simple enough (those are the ones I have docs for).

>cards are working like Intel fashion and we work like Motorola (fortunately).

The byte order differences do not make things more complicated.
They are irritating at times, though, and can slow things down a bit.

Use "Boxkite" - still supported and it supports long filenames.

Greetings,
Matthias

Strictly speaking, an Ajax is required when you wish to send
a 32 MHz clock signal to a disk drive, and read and write 2.88 Meg
disks. A WD1772 02-02 is required, most of the time, if you want
to send a 16 MHz clock to a disk drive and read and write 1.44
Meg disks.

Depending where you get them, an WD1772 can be had cheaply, and
you might pay either 50 USD or 50 Euros for an Ajax chip.

Indeed, I've found it to be almost worthless as it crashes on larger files.
I've also never found a c3d to dxf that works very well either.

Hi Chris

| I've got a big problem setting up a Protar Progate R44 cartridge drive
| (it's a Syquest SQ55) with a TOS2.06 STe. When I first set it up it
| was with a TOS1.62 STe adn it was fine, the supplied software (v4.02)
| worked fine, and it was a doddle to get the whole thing up and running
| as an auto-booting hard-drive. I really need to get it working on a
| friends TOS2.06 machine, she doesn't really want to go back to 1.62
| cos she's got used to the 2.06 desktop shortcuts etc....Whatever I do
| it seems to corrupt the cartridges if I write data to it under
| 2.06....I've tried different floppy drives, I even tried putting in
| different TOS ROM's and I've also tried HD-Driver 6 and 7....It's
| always the same...if I'm in TOS2.06 it'l;l corrupt the whole partition
| if try to write to it, if it's 1.62 it's fine.....any ideas?....is it
| a switch I'm missing somewhere?

You've not got one of the dodgy DMA chips have you?.

How about the fact that it was the Atari guys who designed the motherboard for the Amiga? It just didn't get manufactured by Atari and Amiga took the rains. Too bad they couldn't design it themselves.

No I don't think Atari ST was the best. But neither was Amiga.

Reason? Lack of support for the following functions:
(1) Ethernet 802.3 connection port -- you have to jury-rig using the ROM socket.
(2) Server software -- Macintosh has Appletalk. What does Atari or Amiga has?
(3) I commented on the other post when I read "multitasking OS". OS now are all, by default, multitasking. Even a OS for a small computer like Pocket PC or Palm OS. But this appears to be still a rather novelty with Atari ST.
(4) Neither ST nor Amiga supports AGP.
(5) Neither of them supports advanced 3D graphics.
(6) Neither Atari nor Amiga supports USB.
(7) Neither of them supports Firewire.
(8) Neither of them supports RAID hard disk storage system.
(9) Neither system supports Surround Sound 5.1.

To conclude, neither system is suitable for business use or graphics use. For sound engineering, only the traditional 2-channel (left/right) system is supported. Not Surround Sound 5.1. i.e. No longer suitable for multimedia use.

In other words, both Atari and Amiga are backwards in terms of technology. Why? Because the companies are no longer there to continue the research and development. Major changes with motherboard technology is required to incorporate these new technologies, and 3rd party developers (hardware and software) are not in the position to do just that.

So why are we here? For the obvious reason that we like this computer, and want to continue use it. For personal reason.

Likewise, for personal reason, "Atari is the best".

Purely subjective and biased. Nothing to do with objective quality of the systems. Therefore we all know that it is purely childish to say "Mine is Better". The game play of a 3-year-old.

If you have indeed grown up in the ages of Atari ST and Amiga, you are beyond 3-year-old, for sure. So start acting like an adult.

From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <u798bnkau26u16@corp.supernews.com>
Source record: 37695

Hey guys,

I am having some troubles with my falcon that I would finally like solved. I have a MiNT setup and I try to use XaAES which doesn't work properly.

I tried to use several different vconsoles programs. The setup is a fairly stock easymint setup, but with a modified ttytab.

I use mingetty on the vconsoles and getty on the console. As soon as the console gets to the login prompt all keyboard input ceases to work. But I can hit alt F-key to get to a vconsole in which case input works fine.

If I adjust the ttytab to boot right into xaaes, xaaes runs, and then starts but I have no ability to type anything. Mouse clicks also don't work. Again, I can switch to a vconsole but my input seems to get stolen there too!

At any rate I've had a lot of problems with keystroke theft between applications when trying to use gem/vconsoles at the same time. Anyone have any tips on getting this solved.

Also the vconsole-0.9 uses an /etc/resolution file to determine what resolution the vconsoles will be in. I would like to have a BLACK BACKGROUND with a reasonably high res at 16 colors (ansi if that's possible?) More or less, I want bitchx to be pretty ;)

Thanks guys, so much!
Mark

Actually, the WD1772 is spec'd at a bit above 10MHz (not that this would
matter much).

>Personally I'd feel a lot safer to use a chip that is designed to handle
>16MHz than something that can blow up in your face any minute and leave

Right. Although the chances are good that it won't blow up (it does not seem
to be much of a thermal problem), it will just not work reliably in HD mode.

I think that you aren't really comparing like-for-like: Calamus is really
aimed at the professional market.

Ultimately it's best to use style lists etc as making changes to one's
documents would otherwise take a week and a day!

1553. Hello again folks! Any GEM programming gurus out there?

Newsgroup: comp.sys.atari.st
Date: 2002-02-21 11:43:24 UTC
From: parris_k@yahoo.com
Message-ID: <aa5c37da.0202210343.5ab87462@posting.google.com>
Source record: 37598

Still mucking about with various midi-esque applications and thought I'd put a nice windowy front end on one of them. Is there anyone out there these days who has done much programming with GEM windows? I don't have so many specific questions right now, but it would be great to have somebody who I can contact when I get stuck with things. I have scurfed the net for as much stuff as I could find on GEM, but there wasn't much that I found valuable. I understand the basic paradigm of GEM (and other event driven interfaces) but there a a few specific things which I think may fall under VDI that I'm a bit perplexed by.

cheers and all

I found a German website selling them, and prices are in Euro's (~15E for a
GAL & ~20E for an ajax) so its pretty recent.

do
> and what to look for in my system?

The Ajax is a floppy disk controller chip, pin compatible with the FD1772.
It is a later design, made for higher (High or quad?) density disks.
Later Mega Ste's came with the Ajax (as did the Falcon) and also the
required Gal(s) to support High Density. I believe that U407 (below the
right VME cable) will be missing in early Mste's, and the Gal just by the
power supply will be a -001 version, you need U407 and a -002 Gal to
reliably write HD disks. I was under the impression that an Ajax was
required to write HD in the Mste too. (I know you can mod a basic ST to
write HD by running 16mhz to pin 18 of the 1772, but that is not what I want
to do).

> disks. A WD1772 02-02 is required, most of the time, if you want
> to send a 16 MHz clock to a disk drive and read and write 1.44
> Meg disks.

I was under the impression that an Ajax was required to write HD in the Mega
STE. (I know you can mod a basic ST to
write HD by running 16mhz to pin 18 of the 1772, but that is not what I want
to do). I already have a 1772-02-02 so if that is all I require then all I
have to do is find a HD drive. At the moment I have a DD drive in the Mste,
I originally thought it was a HD so I have to change that. Maybe I will pull
the HD out of the falcon to test with.

> Depending where you get them, an WD1772 can be had cheaply, and
> you might pay either 50 USD or 50 Euros for an Ajax chip.

The normal online retailers I seached yesterday wanted either $40 or £40.
IMO this is unreasonable. I did find a supplier in Germany who has them at
E20 (£12) which I find acceptable.

Does anyone have a copy of RAZR06LS.FNT? I need it to print
a spreadsheet from LDW-Power, which needs it but does not include it.

If so, would they please mail me a copy? Or post it where I can find it. I
do check this group often.

Hello,

Once again I corrected some bugs in SDL. There were problems with
keyboard management with gem, bios, gemdos drivers. With this bug, it was
impossible to use the quake console: when you pressed 'a' for example, it
was no more possible to use this key.

The official SDL version (well, the CVS one) contains the various patches
of the Atari version I did: http://www.libsdl.org/

On my site, you will also find a source patch for mintlib, which has the
CRLF bug corrected, amongst various cleanups.

For the record, DD floppies are still made.

Check out a good office supply place (and no, I don't mean a 'big box'
retailer. One such is Microwarehouse.com (the parent of
Macwarehouse.com). I found a ten - pack for around $6US after less
than 10 minutes of browsing.

I don't know if this direct link will work, but try
http://www2.warehouse.com/product.asp?dept%5Fid=5906&cat=pc&pf%5Fid=ME0423&blind=no

That what it sounds like to me. Can you get the mac to format in 720k
MSDOS? That might do it. I have the same problem when transfering files
from my Hades to my STe. I have to format the disk on the STe first,
insert it into the Hades and then back to the STe. If I format the disk
in 720k on the Hades, I get the same problem you do when I insert the
disk into the STe.

Source record: 37632

To all you Amiga Die hards....letï¿½s face the facts. The Amiga was initially a games console, with the technology of the mid eighties: Lots of graphics effects and colors in low resoultion, 4 channel 8 bit audio for sound effects, the OS being that one of a a games console. The ST was built around acknoweldged industry standards and provided an operating system developed by DRI for professional purposes.

Saying that the Amiga was better than a ST or a PC is like saying today that a Sony Playstation is better than a PC and yeah thatï¿½s true for all the kidies who want to game - but other than that?

The Amigas graphics effects and sound abilities were given at the expense of porocesor speed and system performance. CPU speed and mainboard speed (and thus RAM access) were 10% below ST standard - an issue if applied nowadays to PCs (for example between AMD and Intel CPUs)could mean really A LOT. Ataris had always more RAM than Amigas - in the case of the 1040 ST twice as much. Early Amigas were never able to provide for flicker free graphics in higher resolutions - if someone could call standard VGA resoultion "high". Completely different the Ataris: The ST provided ergonomical working conditions with 70Hz flickerfree graphics. The TT was the first to introduce 19" big screen resoultions. The Atari printing system with their laser printers provided laser printing at a cost where you would at that time only get the laser printer alone for any other platfroms - 10 years before the Windows printing system was developped. No Amiga innovations in this field. The only attempt of Amiga at innovation was inferior to its competitors (the Amiga cased as a CD plï¿½yer as compared to Philips CDI). No portable Amiga solutions, too.

During the years Commodore tried to turn the Amiga into a usable PC. All their marketing efforts and good engineers failed because of the poor system design. Unlike other OSes, Amiga OS was extremely hardware dependend -so tossing the complicated, very difficult to programm and not with any further developements in mind designed Amiga custiom chips in favour of more modern chipssets was simply not possible. Improvements of the Amgia chipsets could be hardly achieved so that even by the time the Amiga 3000 was produced, PC graphics already outperformed AMIGAs by several factors. Completely different the story with Atari: Hardware independent GEM provided true independence of the chipssets through an intelligent driver concept. On Emulators you can see even early Atari GEM applications taking adavantage of todays True-Color, high resoultion graphics solution. Same true for Amiga OS 1.0 or 2.0 applications?

The sound system was so weak that ALL other platforms (Ataris, Archimedes, Apple etc.) were after short time able to provide better sound solutions than the Amiga - with 16bit resoultion, audio input/recording option, more channels, and the DSP of the Falcon is not even mentioned. To cut the cost of the heavily overpriced Amiga chipsets, Amiga started to use cut down versions of Motorola CPUs 68EC020 etc., which made the overall performance picture even look worse. Unlike the Atari with its MIDI/DSP abilities, the Amiga was never able to excel (or be at least usable) in the field (professional graphics etc.) it was supposedly good at without expensive additional hardware (mostly graphics cards...what a joke for a computer with so-called excellent graphics).

The so-called advantage because of its multitasking OS was none, as a) the early Amigas had so little power that there was no real use in multitasking at that time and b) by the time the processing power was there the intellignet, modular OS design allowed Atari TOS to evolve into a true preemptive multitasking system with a UNIX-like kernel while maintaining full compatibility with old applications (sth. Apple was able to achieve only shortly). Just take the possibilities of a LINUX kernel and compare it to the AMIGA OS possibilities - than you will see what kind of advantages there where with MINT/MULTITOS.

To sum it all up, the Amiga was a machine that provided nice effects for games. It was less suited than any other plaform for serious computing (Office, DTP, MIDI/Music, databses and the likes...). Its initial advantages in terms of gaming were mostly and very quickly equalized while the intial gaps in terms of professional usability widened. The end was thus, despite the true and honest attempts of the Amiga engineers and marketing people, clearly foreseeable.

The Atari, on the other hand, would have had the potential to stay in the market but lacked the professional and die-hard contribution of their engineers, marketing people and officials to their platform. Thwe rest is history.

Today, even the cheapest PC can do what any Atari or Amiga could do (well except for the quick Boot-Up Phase of the Atari ST including the GUI). And, during these times, there are Amiga Users who believe in their own irrational world that the Amiga is still a superior concept and want to introduce new Amigas (that is Machines, that in their GUI resemble somehow Amigas but other than that have nothing to do with what an Amiga is). This people are talking about a slick operating system as compared to Windows.

I have news for you Amiga die-hard folks and dreamers of a better future: First of all, any Operating system alternative is better and slicker than Windows (QNX, Linux, BeOS)...and by far not as feature-free as Amiga OS. There is no significant demand for new Amigas. The new Amigas will most definitely fail. Itï¿½s an old, ancient piece of technology not worth further exploration. Most of the younger computer users do not even know what an Amiga is.

Atari people have come to deal with that fact. Their efforts in preserving and getting the most out of the old hardware, building emulations and bridges to more modern hardware, keeping the Atari as a hobby and creating new things to close existing niches are far more sound than the Amiga approach. And Atari ï¿½s still a more reckognised brand that will survive long after anybody knows what an Amiga is.

The industry has become more mature. It has understood that providing a games console with a PC case, keyboard and disk drive will not turn it into a computer.

Cheers,

Alfred

The alignment on a floppy drive is not something you can see without an
oscilloscope
and a specially recorded disk. The alignment on a drive refers to the
aligning of the
read/write head with the recorded tracks on a disk. The head steps at fixed
distance intervals, but the the actual stopping points of the intervals are
adjustable
relative to the surface of the diskette.

Alignment could definitely be the issue here. The alignment becomes more
critical
the further into the drive you step. You are having trouble with large
files but not
small ones. Have you tried copying a full disk of small files. If the
problem is alignment
you should have problems with the later files you copy.

If the problem is alignment, it is hard to determine which drive(s) have a problem without
the proper equipment. A long time ago, before I had an alignment diskette, I
occassionally aligned the old Atari 8-bit drives by using a regular diskette. A customer
would come in with a drive that wouldn't read a particular disk that worked in other
drives. I would make very tiny adjustments until the drive would read the disk in
question. This is not a recommended procedure, but it worked. The 3 1/2 inch
drives have a smaller stepping distance, so you must be even more careful.

In this day of "throw-away parts", you may have trouble finding someone that can
do drive alignments.

In the UK many STFs had single sided floppies, more
importantly, many were only TOS 1.00. These usually, but
not always, had red LEDs.

Hi

Today I discovered that the floppydrive I use to transfer my stuff to my internet box
is failing miserably. Probably since v0.940

This means there is a explanation for all the strange effects, crashes, crc errors,
odd looking panels etcetera etcetera...,
in short: everything that was unlikely to be the result of the improvements as described
in the history file. ;-)

Please wait a short while until the next release.

For more reasons than one!
I know you're just raising these as topics for discussion, but to put the Spring Fair in context...

About 5 years ago the cost a of a 3m*6m stand would be in excess of 10,000ukp. Spring Fair lasts twice as long and occupies at least 4 times the space of the Crufts dog show, which itself would have 30000 dogs exhibited over 4 days. We're talking about exhibition space the size of 6 soccer pitches.

It would also cost more than 20ukp to get in - each... and if your name isn't on the invite list then you simply aren't getting in (I know from personal experience!)

Of course ZControl allows the display of up to 12 CPX's and lets you
have up to 4 open at once.

ZControl v0.25a is the latest I'm aware of.

Good! Now is possible to enter timedemo benchmark ;)

> The official SDL version (well, the CVS one) contains the various patches
> of the Atari version I did: http://www.libsdl.org/

I downloaded and compiled latest version from CVS, but I�m not able to link
any SDL software with it. With precompiled version from your web it was OK,
so I hope you will also update this one.

I compiled several programs: Wolf3D, DGen (genesis/megadrive emulator),
littlejohn(nes/snes emulator), gnuboy(gameboy/gbc emulator), Frodo (C64
emulator) etc. It�s really amazing to see classicall games as Turrican
running in the GEM window ;) It needs very very very fast machine, though.
Anyway, SDL brings new dimension into our TOS boxes. Thank you, Patrice !

Darkling/Newdarkling or whatever ...

The way you act towards people is ridiculous.
Insulting people which every fucking word you pull out has nothing
to do with the freedom of speech.

> I'd rather go to your mama....In fact I freqent her residence often....she
> squeals at octaves which the ST could never produce..

...

Furthermore, you know nothing about anything.
f.e.:
> No it doesn't, midi capabilities on the Amiga were better..Since midi was
> not built into the AMiga, you could upgrade to better and better cards all
> the time, unlike the Shit Thing...

Well, show us the the midi carts available when the Amiga 500 came out.
"since midi was not built into the AMiga, you could upgrade to better
and be ... "
- ohh kid, your brain is dull, your face covered with ....

> Midi sequencing on the Amiga was better and you know it...12 channel
> compared to the ST's 8 channel...The

A basic Amiga had no Midi.
And concerning the normal sound-capabilities:
The ST has been even worse! 3 Channels of that poor YM2149 soundchip,
nothing more! Just the STe introduced DMA digitial sound ...
YOU KNOW NOTHING.

There may various reasons for your behaviour:
-Drugs
-Internet addicted
-40 litres coffee/day
-1hour sleep / week
-60 cigarettes / day
-psychotic
-pervert
-totally freaked out caused by the latter

> I am not starting a flamewar, just stating the facts....

A fucking shit do you state.

> Just admit the Amiga was better in every respect

I ADMIT IT, SUCKER.
You are absolutely right.
EXCEPT: --MIDI--
And don't speak about MIDI cards you could bye ... this refers to:
"YOU KNOW NOTHING."

Prooving yourself being a totally asocial human being is you posting
even in Amiga related newsgroups insulting + annoying shit.

You being a webmaster/net maintainder/or whatever .. huhh.. even
japscat.info needs maintenance. I assume that can be only done by
yerks like you.

Closing with your words ..
" Just zip your lips,loser... "

p.s.: Don't expect a replay, you clown.

> Just what is it that should be adjusted?

The stepper motor. The exact method of adjustment varies depending upon the drive. I am not sure whose mechanisms Atari used in the STE's. I was no longer servicing Ataris by the time the STE came out. I do have an original drive from my Mega. It is made by Newtronics/Mitsumi. It has what is called a screw-type stepper--I believe most short height drives use these. It is a small motor mounted on the back of the drive (on the left when looking from the back of the drive). This motor drives a coarse "threaded" shaft that goes through the drive head carriage. To adjust the alignment you need to loosen the locking screw(s) very slightly--you do not want to be able to turn the motor very easily. You then rotate the stepper motor to adjust.

>

>

The test disks I have worked with are not system dependant. They have a specially recorded signal--something of the form of a sine wave. You use a dual-trace scope on test-points on the outputs of the drive head to balance the amplitude of two out-of-phase signals.

However, as I mentioned, I have had success without the special disk or a scope. What I have done is to use a disk formatted and written by a known "good" drive with data that cannot be read by the drive to be aligned. Adjust the stepper alignment while attempting to read from a sector (or a file) that you having trouble with. Try a small amount of movement in one direction. If that doesn't help try the other direction. You may want to scratch a set of marks in on the stepper and the drive frame to indicate the current alignment before you start.

I hope this helps you out. Let me know.

What do you want to know? You pretty well descriibed the whole
thing. It lets you run a mutlisync monitor (the old style that could
sync down to CGA video frequencies) from your ST .. or you could run
an old Commodore monitor with composite inputs from your ST (you could
do it, but a composite monitor was really crappy looking video
compared to a regular Atari monitor or the multisync monitor). You
can't run a standard VGA monitor or a modern multisync on the omniterm
(wrong frequencies). So look for a "way old" CGA capable multisync
monitor.

The floppy drive switch was basically to let you switch between an
external 3.5" drive and and external 5.25" drive as your B: drive
(that was back in the days of PC emulation with PC-Ditto ...
when PC's had 5.25" drives instead of 3.5" drives).

You need the Atari cables (video and the floppy drive cables).
Actually you can use the omniterm just as a floppy drive switch, just
as a video converter, or both at the same time. No power supply
needed - the only thing to it is the ugly long box (it came in a
putrid white and in a kind of close to atari gray color ... but no
matter what color, it was just plain unattractive). Fortunately it
was "somewhat" functional.

Freedom 115E is the English version. I'd probably try the Interactive web
site, since it was their translation, or I can send you the archive myself.

>And is it still being supported (or the shareware key given freely if
>it's not supported/developed any longer)?

I'm not sure of its present status, however there was a later version
released. I don't know if it's in German or English!

BTW did you get the PCB Designer archive I sent you?

Fair enough. I don't think that there are any icon editors that are aimed at

the novice/tinkerer though.

>* Although the are English RSC files (downloadable from your site) there
>aren't any English ST-guide (.HYP) files.

There won't be. Takes far too long to translate/keep the links working/etc
for any hypertext I'm afraid :-(

>Not everything in the program has been translated either (probably stuff
>which isn't contained in the .RSC file but the program itself).

Very likely. That's overcomable.

>* The installation is rather confusing as it's in German and complains
>about missing files, shared library folder (whatever that is) and other

I can't remember how I installed the version I have here - possibly it
arrived in "pre-installed" form.

>* If an icon has been changed and you exit the program you don't get the
>usual alert saying something like:
>"The file has changed [Save] [Abandon] [Cancel]"

I've just fired it up, created a new icon, and it came up with that alert
box when I quit without saving?

I have found that certain drives just do not work together. If you have
access to any other computers, try transfering files between them and
the Mac/ST and see what happens.

I've heard that the later version introduces more problems for some people
though.

>Freedom 2 supports CPX modules, so it's a replacement for "Xcontrol.ACC"
>as well. Does version 1.15 do this?

No, it doesn't. It does have the ability to launch progs directly from the
directory listing which can be quite useful though.

If I weren't so lazy I'd probably re-install it in preference to Boxkite -
but the latter seems to protect better against trying to use long filenames
with progs that don't get on with them ISTM.

>> BTW did you get the PCB Designer archive I sent you?
>
>Yes, several days ago. Didn't you get my email message?

No! I guess that you've been able to convert those files by now.

: But I'm curious about those other file-selectors as I need to take some
: screenshots for the TOS 2.06 user-guide.
: Freedom 2 supports CPX modules, so it's a replacement for "Xcontrol.ACC"
: as well. Does version 1.15 do this?
: Anyone got Freedom 1.15 working well on their systems?
: Is it worth another go?

It has a quite long configuration file, and it took me some time and
a lot of e-mail back and forth until I got it right.

Since then, it has been working very well in single-tasking TOS,
and I am most happy with it. It is worth another go.

Freedom 2, when it came out, was not as well received. I do not
have it, and nobody has succeeded in convincing me to get it.

But for multitasking, boxkite seems to be the way to go. Does
multitasking, long file names, and is supported.

Yep, free.

I've got a copy of Steinberg Cubase 3.1, boxed but with no manual, and including the DONGLE.

Great condition, and it all works perfectly.

Also in the box is Cubase Score.

I'm in Manchester - 'buyer' collects - I'm not posting it!

If no-one wants it, it's going in the bin... ;-)

First to respond here can have it.

Jay

I have heard that -sometimes- it helps (and not only on the STacys) to
install larger (but not too big) electrolytic capacitors on the 5V and 12V
supplies. It would improve things somewhat if your problem is just the
transient current peak being a tiny bit too large during the spin-up of
the floppy or the hard disk.

Btw. did you monitor the supply voltages with a voltmeter? What is the
voltage with everything installed and in steady state, and how bad
is the drop when the floppy tries to spin?

cu;

>about?

* There is a .CPX module (ICONEDIT.CPX) for editing the DESKICON.RSC file.
It has only basic drawing and editing capabilites but for a simple 32x32
image like a desktop icon it is quite sufficient in most cases.

* Ronald Andersson (of Sting fame) has at one time made a COLORTOS package
which allows the use of colour and animated icons in TOS2.06. IIRC it
does not work well with TOS on which the resource/newdesk patch has been
made, but is OK with a nonmodified TOS (I do not remember very well).

Well, you should have a look to the cross-configure.sh and cross-make.sh
scripts that are in the source archive of the patch:

The latest version of Freedom is 2.05. I believe there exist an Englsih
version of it. It's on the Belgian ftp-server:
ftp://chapelie.rma.ac.be/atari//utilities/file_selectors

-rw-r--r-- 1 ftp 39509 Nov 10 11:45 bkit231e.upl
-rw-r--r-- 1 ftp 124454 Nov 10 11:36 bkit231e.zip
-rw-r--r-- 1 ftp 151246 Oct 19 21:21 bkite231d.zip
-rw-rw-r-- 1 ftp 382898 May 5 1999 frdm205d.zip
-rw-r--r-- 1 ftp 146364 Mar 10 2000 frdm205e.zip
-rw-rw-r-- 1 ftp 380785 May 5 1999 fredm204.zip
-rw-rw-r-- 1 ftp 23925 May 5 1999 uis332r1.lzh

frdm205e.zip contains only the English version of F2KONFIG.CPX and
FREEDOM2.ACC. No docs.
I'm afraid though you've to wait until the server is up and running
again. There seems to be a small problem. Unfortunately it's weekend so
it's hard to find someone who can fix the prob.
>
>But I'm curious about those other file-selectors as I need to take some
>screenshots for the TOS 2.06 user-guide.
>Freedom 2 supports CPX modules, so it's a replacement for "Xcontrol.ACC"
>as well. Does version 1.15 do this?
>Anyone got Freedom 1.15 working well on their systems?
>Is it worth another go?

No freedom 1.15 doesn't support cpx modules. I've used v1.15 for many
years. First on a TT030 and then on a Hades060. Both machines are running
FreeMiNT. The only problem I can remember is that for some reason
Freedom 1.15 got killed after it was called X-times. It believe it was
around 35 times calls.

For me it was a very good fileselector. I only dumped it in favour for
Freedom 2.05 because that annoying problem.
As said I'm using FreeMiNT so it's possible the above problem doesn't
occur with other OS's.

Until very recently I was using Freedom 2.05 on both systems. It was
very stable but some applications such as Okami, Porthos, Idealist and
Calamus SL2002 didn't like Freedom (or should I say Liberty, the system
extension used by Freedom?) very much. I could live with the minor
problems I had with Okami and Idealist but not with the problems I had
with Calamus SL2002. Although I did use the build-in fileselector of
Calamus SL2002, Calamus was unstable. That's the only reason why I'm
using Boxkite (which I don't like very much) right now.

As Freedom 2.05 is know as a program which does some very dirty tricks to
achieve it's aims I can't ask the programmers of the other programs to
adapt their application.

>> >And is it still being supported (or the shareware key given freely if
>> >it's not supported/developed any longer)?
>>
>> I'm not sure of its present status, however there was a later version
>> released. I don't know if it's in German or English!

See above. The latest version is 2.05. This version is *still shareware*
but with no restriction at all. It's fully usuable.

CU
Martin

it pisses me off seeing amiga users acting so stupidly, using amiga myself
im disgusted that these ''I'd rather go to your mama....In fact I freqent
her residence often....she squeals at octaves which the ST could never
produce..'' lamers infest non-amiga newsgroups/forums whatever with their
bovine presence and unoriginal euphemisms. you really make us look bad, and
i will stress now that his behavior doesnt reflect on me and most of us.
there might be atari st kiddies who act the way you do, but there must be
alot less of them because i havent seen one yet i have to admit. also i

subscribed to this newsgroup because i actually like the st alot and enjoy it, dont subscribe if you're just going to come here and be childish, its not cool.

As soon as I get interested in some techincal advance and invest in it (ie, pay up), along comes another killer tech-advance that makes every previous advance useless. The story of my life :)

New Scientist, 19/02/02, 16:50: "Replacement for DVD unveiled."

"The world's Big nNine electrontic companies have swallowed corporate pride and agreed on a single standard and name - Blue-Ray - for the next generation video and computer optical disc."

It uses a blue laser: a single-sided 12 cm disc stores 27GB data or 13 hrs TV or 2 hrs hi-def video. Present CD/DVD tools cannot read it.

So, hold it, fellow Atari & Mac Users (PC? ugh), if you want the latest.

Bang goes my dream of getting an iMac with Superdrive.

Charles.

Charles, it'll be at least 5 - 10 years before this alleged 'replacement' is going to kick in. Look how long it took for DVD. Even if it did come out earlier than I predicted, it's not gonna kill DVD. DVD hasn't killed VHS yet. Go ahead and buy the iMac with superdrive. The computer itself will be obsolete by the time the new technology arrives.

Joshua.

Perhaps it should be NewNewDarkling. lol If my attempts are so lame
then why keep changing hosts. Go back to your original host and prove me
wrong, but I suspect you can't. There is no arguement, that's in your mind.
Both machines have there place, both accel in some areas, both are more or
less names left over from an era. But since you are posting negatively
on the amiga section, you are now considered a complete joke.

The amiga is completely useless to me, however I am refer to me. Be that
at it may, I have not and will not ever go to the amiga section and say
anything at all. They have their own little world to live in, that's cool,
if one is happy that is the goal...

btw, I suspect you are related to sinclap.

1629. SCREEN GRABBER & ETC

Newsgroup: comp.sys.atari.st
Date: 2002-02-24 02:19:52 UTC
From: dwolfe@netcentraltv.com
Message-ID: <a59ik7$5r6$1@news.chatlink.com>
Source record: 37581

To All,

Two questions:

I want to copy some Recipes off the Internet without printing the whole file. Would a screen grabber accessory be the right tool to cut one recipe out ?? If so, what is the best ACC for the Atari and where can I D/L it ??

2nd question, I have a Atari 44mg removably running off a 520ST DMA port, I want to copy some files to this computer, but my double sided external drive is acting up. So can I connect a Syquest 135mg that is using a Link 2 cable to the out port on the back of the Atari 44mg drive or will the link 2 try to convert DMA to SCSI and the 44mg has probably already done this ?? I don't have a plain DMA cable that will connect to the Squest 135mg which has the big SCSI port.....

Thanks for any help!!

well, these Atari guys who designed it might have been such as they worked for Atari, but these same guys also left Atari because they ddnt want to take Atari's crap. Amiga as a company only exists recently, it was Commodore that got their hands on Amiga by financing its development knowing well that the designers could not pay them back by the deadline they had set. it was a very rotten and business-wordly thing Commodore did.

hmm, admittedly theres something i didnt know. could it be they were hired to spite commodore? and possibly get a little inside scoop on how the amiga works to try and emulate her? now im not trying to start an argument with anyone, but its well known the guy who bought atari at the time when the amiga designers just left was mighty pissed off about it, he really wanted the amiga to be atari's, the st was atari's answer to what they lost, amiga.

Source record: 37588

Evidently I need a Link97 as my ICD mini controller seems to be incompatible with about every scsi device I try, other than the internal 80meg HD I have. I would like to buy one, I tried http://www.wbsystemtechnik.de/atari/in_e.htm but they never answered my email inquiries. Is there anywhere I can get a scsi controller that will work with modern scsi devices such as ZIP/optical drives?

Hey,

Is the AJAX chip in the Falcon exactly the same as one that you would find
in a Mega STE with Factory installed HD disk drive, internal
SCSI drive and TOS 2.06???

Reason I ask is that I have a brand new Falcon AJAX chip that I got from
Computer Studio awhile back. It's still in the original package.
Would like to know if I can use it in my Mega STE just in case its AJAX chip
goes down. The Label on the plastic package lists it as
a Custom AJAX for Falcon 030. Not sure what Custom means in this case.
Aren't all Falcon AJAX chips the same???

Sorry John I can't help ya out with the copy protection, although I have
been trying to get ahold of a original last version of
Phoenix and Xenomorph with manuals for along time now. I cant remember if
these are the same program or are different.
I remember looking at a demo of them from ST FORMAT. I would be interested
in these if someone has em for sale or
trade.

The external ScreenBlaster II is really cool. You can get tons of way cool
resolutions on a good SVGA. It will work with the Videlity
ScreenBlaster option, though I've not used it that way much. The standard
software that comes with it worked good enough for me.
I'm not sure, but I'd just about bet that the software for the External and
maybe internal BlowUP resolution enhancer would work with
ScreenBlaster hardware as well.

I have no voltage data to offer - at the moment - but I believe this internal converter outputs 16v for the screen as well as the 12 and /or 5. The symptoms certainly seem to suggest that it is a transient current peak. For intance if I remove 4mb and install 1mb RAM the thing works fine .With all upgrades intalled it's like the last straw. Truth is, I don't have the theory to be able to interpret any readings. What points would I meter across ? I would be quite happy installing larger capacitors from a mechanical point of view but I don't understand the values needed.
Thanks for your interest enough to reply

> Actually I'm learning a lot of new things myself as I'm going along!

And there is one more thing. I suppose not everyone knows that, but
I also doubt if it is worth mentioning in a beginners guide to TOS... ;-)

I will try to describe it as good as possible, but it would really
be better to *show* it instead of describing... ;-)

Anyway, let's say you have two windows opened. One shows C:\GEMSYS\
and the other D:\TEXT\. The active (topped) window is the second one
(with D:\TEXT\). Normally you cannot start a program from a window
that is untopped, first you have to activate it. But...

But you may *hold down* the *right* mouse key, and then (still
keeping the right key held down) doubleclick with the *left* button on
any program icon in the *inactive* window. This will start the
clicked program, but the pathname it will receive from the system
will be taken from the *active* window. In this example, it will
be D:\TEXT\. So, the program will look for its resource file *not*
in the folder it has been started from, but in the folder that is
opened in the topped window.

Originally it was a bug in early TOS versions (!), but when the TOS
programmers realised it is there, they *left it* and it was actually
officially stated by Atari that such a behaviour of TOS will be kept
in the future versions. So it works with *all* TOS versions, or at
least it should.

Are there any ways it may be used in practice?

For example, when you install ZIPJR.TTP as an application with
"Default directory: Top window" and "Parameters: Full path", clicking
on a ZIP archive will cause it to be unpacked to the folder where
the ZIP file is located in. But when you open any other window,
and leave it active (topped) and then doubleclick (in a way described
before, holding the left button) on a zip archive in an inactive window,
it will be unpacked *to the folder from the topped window*.

Useful, sometimes - isn't it? ;-)

If the out port on the 44MB drive is a DMA one (19 pin) then just plug your
LinkII/Syquest in. If it's a 50 pin Centronics then you'll have to use that
instead, plugging directly into the Syquest. You'll have to make sure that
you remove the 44MB drive's termination if you have to go this route (and
terminate the Syquest) if you go this way.

Donner how are you? Nice to talk to an ex-Genie user. Yes, you could do it that way you suggested, but I would do it another way. Just save the screen as a html file. Then convert it to txt using a program that does this, cut out what you want and then print it or save it. Of coutse I am assuming you are doing this on an Atari, but I guess it could be done on a PC.

Hei.
I noticed in the tit for tat between Amiga (cough) and Atari (love) somebody mentioned Atarippc.
Did this become a pie in the sky project or is there some serious effort in this new machine. At present
I use a macppc pb1400cs and even for it speed and comfort it's reliable. But if a equal spec Atarippc
was made I would gladly buy.
(This Atari is not dead but just resting) :-)

regards

JNO

Hello all,

I am trying to install EasyMint on the Hades. I just about have the installation working except I have
run into a snag. I can get it to install the root system, but the problem comes when it trys to install
the packages (Basic, Standard, etc). In the loading process there comes a point when the program
says Copying. Then comes Unpacking. When these come up, my computer does nothing. What I mean is that I hear nothing comes from the drives. It is like the process is being done in memory.
Of course I get an error message when it trys to install the rpm files. Anyone have an idea as to why
this is happening?

I may have to install the packages manually. That is ok with me, but I
would like to do it the easy way.

Hello :-)

> I have the Link II in my STe and it works fine. I just install a SCSI
> CD drive. Of course I use HDDriver which makes all the difference.

I have The ICD Link II too with a Mega STe and it works fine too. I have an internal 240 Mb SCSI hard disk, an external 44 Mb SyQuest and a 12x external SCSI CD-ROM. I use ICD Link Utilies and ExtenDOS for the CD-ROM ... and all is fine :-)

Regards ...

Those monitors are usually worth a few bucks.

Unfortunately, with it having been stored in LA, it may have been subjected to 'smog', which fogs up the screen somewhat, rendering it totally worthless.

;-)

I'm kidding, of course, before anyone flames me!

Hi there!

Is there a Linux driver for the ATARI Portfolio's memory card
reading device HPC-301?

Thanks in advance for any hints!

Christian.
P.S.: I hope this is the appropriate group for this kind of
question. I didn't find a general ATARI newsgroup on my
newsserver.

Hey,

This is straight out of my 520ST's manual. It is a port view (looking at the computer) and pin 1 starts from the top RIGHT and goes to pin 10 on the top left. Then pin 11 starts at the BOTTOM RIGHT and goes to pin 19 on the bottom left. Clear enough? ;)

1 - data 0
2 - data 1
3 - data 2
4 - data 3
5 - data 4
6 - data 5
7 - data 6
8 - data 7
9 - chip select
10 - interrupt request
11 - ground
12 - reset
13 - ground
14 - acknowledge
15 - ground
16 - A1 (heh, I don't know ;), it's what was written)
17 - ground
18 - Read/Write
19 - Data request

Hope that's what you were looking for..
Thanks
Mark

I saw him on ICQ the other day, forgot that you wanted him.

Do you have ICQ (ICQ on the Atari is not working properly atm), but if you
have a PC available?

His ICQ UIN number is: 18116827

Try looking on http://www.icq.com/18116827 which should be his ICQ
Communicator page. If you don't have ICQ you can type in a message to him
there and it will be sent to him the next time he goes online with ICQ.

Cheers!

James

The market value of those things dropped quite fast, when the
Atari warehouse clearance sale sold a TT030, which used to go for nearly a
thousand dollars, and a TTM195, which used to sell for over a thousand
dollars, for $453, together. Got one of each for that, and was delighted.

If I had to hazard a guess, it would be between $200 and $300. Sorry, but
I have two, and do not want another. That is if you find several
interested buyers. I got the second TTM195 and a TT from Germany, on Ebay,
as the only bidder, with no reserve, for about $250 and $250 shipping. $64
in damages, for a used case for the TTM195 after it got here.

So that's my guess, and why. Your mileage may vary.

I tried HDDriver it wouldn't work either, I have a lot of experience with SCSI drives too everythings hooked up right. I need to get a controller that will work with ZIP and optical drives, can someone please tell me where to get one? The controller I have appears to be a "Micro ST" by ICD, thats all it says on it.

>
> Were are the differences between version 1 and 2?

Version 1 did not do true color, one had to buy an add-on daughter board. I am not sure exactly what color planes the add-on board allowed.

Version 2 does 24-bit true color right out of the box.

> Are they working in a TT and as well as in a Mega STE?

Works in my TT. I don't know about the MegaSTE, my manual is german. ;-)

> Where can i find drivers?

The original drivers are very bad. NVDI 4.x ET4000 version, or the newer NVDI v5.x package will fully drive the card.

> Is there a spezial Homepage about them?

Not that I am aware of, they are no longer made.

From: John Perez <jhperez@uhunix1.its.hawaii.edu>
Message-ID: <a5clet$2rd$1@news.hawaii.edu>
Source record: 37515

Greetings,

I'm looking for any ideas that people may have for converting Stereo Cad/Cyber Studio 2 files (3D2) to other formats, particulary something that 3D Studio Max can read (from the same fellow that made the Cyber Cad series!). I have been told that Rosetta doesn't work very well, and the rendering program that I have tried (Phoenix II) requires words to be typed from the manual which is in storage, and doesn't work in Gemulator anyway (submenus like objects or lights cannot be closed)..

Any help would be appreciated.

Are there any freeware 3D2 converters?

John

1670. MagicPC <> PC Keyboard

Newsgroup: comp.sys.atari.st
Date: 2002-02-25 12:54:39 UTC
From: Mathieu Demange <m.demange@free.fr>
Message-ID: <3c7a340e$0$8735$626a54ce@news.free.fr>
Source record: 37524

Hi there ;-)

Does someone know about how to use my PC keyboard like a _PC keyboard_ under
MagicPC instead of
keys that give me bulls when I type anything ?

I think about KEYTABLS.SYS files...

Any other solution ?

Thanx

Mathieu

1671. Re: STfm DMA cable pinout?

Newsgroup: comp.sys.atari.st

This is from Atari ST Internals by abacus software, quoted verbatim.
"A1 Address1. This signal tells the device's DMA controller whether the
device address is set on bus with all commands (A1 = low) or whether
parameter bytes are handled (usually 5 parameter bytes; A1 =high)."
Don't ask me to translate all that though as I can't
Anyway hope it helps.

> If I had to hazard a guess, it would be between $200 and $300.

My guess is a TTM195 is probably worth a minimum of $150, up to maybe
$250. They were $150 at the Atari warehouse sale which was a real
bargain then, and now.

I'm constantly amazed at the prices TT stuff brings on eBay. A TT030
WITH a TTM195 just sold for $250, a real bargain, but did you see the
Crazy Dots card the same guy sold yesterday for $306.00?

>irritating grinding noise).

In fact both the HD and the DD drives need 3ms stepping rate; when the
floppy controller chip is driven by a double-frequency (16MHz) clock
(as needed for HD floppies), the set-up 6ms stepping rate (actually
a value in a register of the flopp controller chip which governs the
counter/divider) will become 3ms in reality.

LS

A new version available on my homepage.

1
Fix in windows noleft feature with live moving.

2
Wrote the user interface for toolbars and menus in windows.

wind_set(window_handle, WF_TOOLBAR, object, start_item, edit_object)
wind_set(window_handle, WF_MENU, object)

The XaAES toolbars are fully functional dialogue panels.

There is no need (although provided for comapatibility) for the FTOOLBAR/
NTOOLBAR rectangle retrieving mechanism.
Simply call wind_set(WF_TOOLBAR) again with the approppriate start item
will redraw the objects using the rectangle list.

3
Fixed a enormous hole in the screen locking mechanism.
XaAES didnt lock its owm writing to the screen. :-/

4
This distribution should overcome the corruptions of the previous.

Read the history file!

I think 6ms step is only used when you have HD disk formatted in HD
AND the drive is working.

Some years ago, I put a 2.06 tos in my STE(not a mega ste) with a
automatic clock electronic board for the Ajax controller.
Thie board detect the HD hole from HD disk and then set ajax clock to
16MHz.
I solded(?) the pin(the same as in the mega ste) which say to the tos
there is an High Density drive connected.
It worked fine without any additional program in directory 'AUTO' but
the step was 6ms when the disk drive was working(I heard it with DD
disks!). This don't work with tos 1.62(it needs program in 'AUTO')

I think the tos 2.06 change the step to 6 ms and use 16MHz clock when
it do a step, then go back to 3ms step and 8Mhz clock (with DD disk).

Sorry, this not a very comprehensive explanation.

Some SCSI devices need parity.
Perhaps your ICD mini controller does not provide parity?
Take a look, on some device you can disable parity.

Other possibility (if this card is internal card for Mega ste):
Try to put SCSI ID to 0.
The original internal scsi card from atari can only use scsi ID 0 and
perhaps yours too.

>
> Reason? Lack of support for the following functions:
> (1) Ethernet 802.3 connection port -- you have to jury-rig using the ROM
> socket.

Bullshit, the A1200 had a pcmcia card slot...(ST didn't)...The big box amiga's had Ariadne...ONly the A500 couldn;t be used withiout hacking, but then when we are comparing the ST and the Amiga, the Amiga is better....

> (2) Server software -- Macintosh has Appletalk. What does Atari or Amiga
> has?

ANy TCP based programs...And many others...COmmercial and Freeware...

> (3) I commented on the other post when I read "multitasking OS". OS now
are
> all, by default, multitasking. Even a OS for a small computer like Pocket
> PC or Palm OS. But this appears to be still a rather novelty with Atari
ST.

Yes the Atari's OS was laughable...

> (4) Neither ST nor Amiga supports AGP.

Thats because AGP wasnt even envisioned when the Amiga and ST were reelased...it didn;t even exist...HOWEVER< Amiga being an Amiga, you can get a bus expansion board for Amiga's and it CAN take AGP cards!! Not so the ST, again falling behind..

> (5) Neither of them supports advanced 3D graphics.

Read above. ALso, why was OpenGL API's coded for the AMiga??

> (6) Neither Atari nor Amiga supports USB.

Rubbish, !200 and above can have USB expansion...

> (7) Neither of them supports Firewire.
> (8) Neither of them supports RAID hard disk storage system.
> (9) Neither system supports Surround Sound 5.1.

Agaon, this concept never existed when the AMiga and ST were released...thats like saying the 286 can't run 64 bit software, or basic

MSDOS can't access more than 640K, since at the time epopel thought that
that was the best they could habve...

However the Amiga comes out on top again since it can be UPGRADED, the ST
can't (unless you do dtupid things like start resoldering socketed chips)...

>
> To conclude, neither system is suitable for business use or graphics use.

Yeah, whatever....WHich is why both of them are still being used today, for
exactly those purposes....

> For sound engineering, only the traditional 2-channel (left/right) system
is
> supported. Not Surround Sound 5.1. i.e. No longer suitable for
multimedia
> use.

You can stcik a Soundblaster Live into a PCI A1200 and it CAN have Surround
SOund 5.1....Canthe ST?? NO...

>

> To all you Amiga Die hards....let's face the facts. The Amiga was
> initially a games console, with the technology of the mid eighties:

Yes, just like the ST...

And in fact it was FIRST designed as a flight simulator, and SECOND as a
games machine....

> Lots of graphics effects and colors in low resoultion, 4 channel 8 bit
> audio for sound effects, the OS being that one of a a games console.

Ha ha ha the OS was a unix-based multitasking OS...

> The ST was built around acknoweldged industry standards and provided
> an operating system developed by DRI for professional purposes.

HA HA HA HA HA !!!!!!!!!!!!!!!!! The shite couldn't even multitask!!!!

>
> Saying that the Amiga was better than a ST or a PC is like saying
> today that a Sony Playstation is better than a PC and yeah that's true
> for all the kidies who want to game - but other than that?
>

> mainboard speed (and thus RAM access) were 10% below ST standard - an
> issue if applied nowadays to PCs (for example between AMD and Intel
> CPUs)could mean really A LOT. Ataris had always more RAM than Amigas -

Wat, 512k??? And you couldn'tr even have a RAM upgrade?? Is that why ST's
always had MORE ram than AMiga??? Get your facts straight...

> All their marketing efforts and good engineers failed because of the
> poor system design. Unlike other OSes, Amiga OS was extremely hardware
> dependend -so tossing the complicated, very difficult to programm and
> not with any further developements in mind designed Amiga custiom
> chips in favour of more modern chipssets was simply not possible.

Is that why the Amiga is upgradeable and the ST isn;t?? Is that why the
latest version of Amiga OS is runnign on the new Nokia MediaTerminal and the
SHARP Zaurus PDA, not to mention many new devices...And where is TOSh???
DEAD...

> Improvements of the Amgia chipsets could be hardly achieved so that
> even by the time the Amiga 3000 was produced, PC graphics already

> outperformed AMIGAs by several factors. Completely different the story
> with Atari: Hardware independent GEM provided true independence of the
> chipssets through an intelligent driver concept. On Emulators you can
> see even early Atari GEM applications taking adavantage of todays
> True-Color, high resoultion graphics solution. Same true for Amiga OS
> 1.0 or 2.0 applications?

All I have to say is: The AMiga had

Cybergraphics
AHI
Audio/video independent API's which allowed the OS to use any chips even
thoguht they are non-native, ie permidia, old S shipsets etc...
ANd older Yamaha sound chipsets...

You don't have a leg to stand on...
>
> The sound system was so weak that ALL other platforms (Ataris,
> Archimedes, Apple etc.) were after short time able to provide better

Yes, thats why all games soudn better on the AMiga than on the ST..listen
tot he intor's of Speedball, better yet Xenon II and compare the 2 sound
effects...

> worse. Unlike the Atari with its MIDI/DSP abilities, the Amiga was
> never able to excel (or be at least usable) in the field (professional
> graphics etc.)

What pure bullshit....What was Babylon 5 done in?? WHat about Jurassic Park
rendering done in? Max Headroom?? ITV chart show?? Early episodes of Star
Trek TNG??? MOst post-production digital houses used the AMiga...Rolf Harris
Cartoon Club..I could go on and on...YOu make a fool of yourself...

>it was supposedly good at without expensive additional
> hardware (mostly graphics cards...what a joke for a computer with
> so-called excellent graphics).

Yes that so funny...thats why its so heavily used in the industry...

>
> The so-called advantage because of its multitasking OS was none,

>as a)
> the early Amigas had so little power that there was no real use in
> multitasking at that time and

Ah how cleverly you side step the issue...Forget the power for now, the fact
is that it COULD multitask...thats somethign the ST could not do...

>b) by the time the processing power was
> there the intellignet, modular OS design allowed Atari TOS to evolve
> into a true preemptive multitasking system with a UNIX-like kernel
> while maintaining full compatibility with old applications (sth. Apple
> was able to achieve only shortly).

Your kernel is crap, the AMIga has always had a microkernel which loaded services and modules dynamically without having to recompile the whole kernel..It was based on message passing and the ST wasn't...Even to this day the kernel is well reknowned...Thats why Samsung tried to buy Commodore for its OS and chipset...as did Philips...

So stop going through all those old The One for ST magazines and putting together crap from various episodes...

>Just take the possibilities of a
> LINUX kernel and compare it to the AMIGA OS possibilities - than you
> will see what kind of advantages there where with MINT/MULTITOS.

Linux kernel is a monstrosity...every other week its being updated...Thats the bigfgest drawback of Linux....I wont; even bother replying to the above claptrap...

QNix is the most stable realtime OS in the worl...it was based upon AMiga's EXEC...

>
>
> The Atari, on the other hand, would have had the potential to stay in

What a hypocrite, since the majority of the replies are from you!!! YOu are FUNNY.....

Please read my discussion about Linux/Qnx and TOS with abother member of this mailing group....I think its Mark Duckworth...

The problem with you, Persson, is that you can't handle the truth and now you think you can make other peopel's decisions for them by telling them not to reply to me...Do you think they are all stupid?? Can't they make up their own minds??? If they think I am a troll they won;t reply...They have brains as well...Why do you think you are special and have to tell people what to do?? WHy give them advice about not replying to me (which you ignore yourself)???

Sorry

Not knowing much about the Amiga, what were the specs of the laptop based Amigas, as far as I know there were not any.. Atari have the Stacy, so does that count as something
superior to the Amiga if there is no laptop version of the Amiga?

Let me know, just interested... not an arguement.

Thanks,

Richard.

Just to note, DVD and CD are incompatible formats. DVD players that
can also read audio CDs actually have two lasers. Thus, Blue-Ray
devices (the name will likely change by the time it's in consumer
equipment) will likely have regular DVD lasers to provide for
backwards compatibility.

Interesting comment, you don't need Atari's help.... try to remember, Amiga was in desperate need of cash in late 1983, if Atari hadn't gone into contract with Amiga for exclusive licensing of the chipset and supplied Amiga with $500,000 needed to complete the chipset, Amiga may very well have gone belly up and the chipset would not have made it to working silicon.... (its a shame, that on June 30th, 1984 instead of delivering the silicon, Amiga instead gave Atari a check to pay back the $500K and went into breach of contact, but then again, if the Tramiels had gotten their hands on the chipset, they may very well have drove it into the ground as they did with most things they layed their hands onto) however, the Amiga's were and certainly still are wondeful machines.... the ST's by the TT and Falcon became nice machines as well, out of the gate in 85' they were great machines, but quickly feel behind as the Mac, Amiga and even the PeeCee quickly caught up and surpassed them which was a shame, they had a lot of potentail but the meger updates and empty promises and a lack of focus on where the product line should move to hurt the ST's badly.

1709. Atari stuff for sale - MagiC 6, NVDI 5, CD-ROMs, games

Newsgroup: comp.sys.atari.st
Date: 2002-02-26 04:36:40 UTC
From: Daniel Dreibelbis <dreibel@sympatico.ca>
Message-ID: <dreibel-573FB9.23364025022002@news.bellnet.ca>
Source record: 37413

Just going through my stuff here, and I found all sorts of stuff here that I don't need or am not using. So before I put all this on Ebay, I'll give the newsgroup a chance to purchase these from me.

Everything is marked in Canadian Dollars (so you in the US who are looking for these will get these at a great bargain :)) All successful bidders will pay for shipping.

NVDI 5 upgrade disks - two disks, 1.44 MB format - $40 CDN

MagiC 6 upgrade disks - two 720K disks, manual - $40 CDN

Stardust (game, in box with manual) - STe/Falcon compatible - $10 CDN

The Chaos Engine (game, in box with manual) - $10 CDN

Obsession (game, two disks plus backup disks and manual) - pinball game for STe and Falcon - $10 CDN

Substation (game, three disks with manual) - DOOM like game made even more challenging by racing against the clock, awesome sound support, STe/Falcon - $10 CDN

Monty Python's Flying Circus (game, one disk with manual and button) - amazing Python-related game, Mr. Gumby is in search of his brain - $10 CDN

SKYLINE CD - CD-ROM with many useful shareware and freeware programs, MODs, also includes full versions of OCR 1.3, maxidat, Tempus Word Junior, Idealist 3.54 - $10 CDN

Crawly Crypt Collection CD 1 - CD-ROM with shareware, freeware - $10 CDN

Atari Compendium CD-ROM - CD-ROM version of the comprehensive programming tome, in HTML format for reading with a web browser, Also includes programming utilities and a variety of Shareware. $15 CDN

Suzy B's Collection - 2 CD-ROM set of freeware and shareware for the Atari . This is one incredible collection, with files that you won't find on many other CD-ROM collections. $20 CDN

If you're interested, e-mail me and I'll get back to you ASAP......

>

One quick question. When you indicate error, does this mean that it
couldn't read any
files or just some of them.

This could indicate a difference in the low-level format. When a disk is
formated,
IIRC the software/OS configures all of the data on a track, including the
inter-record
gap data, track headers, sector headers, etc. I thought it was fairly
standardized, but
it might be possible that the two use slightly different configurations that
the other
doesn't like. Therefore, one would have to assume that Sony (or an actual
MSDOS
machine?) uses a third configuration that both can get along with.

> I have various programs for checking disks ("Knife-ST", "SED" "Egale"

> from the results as well.
>

I have only worked with a couple of tools on the ST, and that was a long
time ago.
I don't even recall the titles. I should still have them around. I do not
remember
any of them having access to non-record (non-sector) portions of the disk.
I
had some access to this data on the 8-bit with an old Micro-Mainframe drive
that I had. I believe it came with a utility that would let you dump an
entire
track and see the inter-record data.

> getting power of course).
>

I haven't looked into getting one of these disks in a long time, so I have
no idea on price and availability. The disk with the alignment signal

recording
is usually system independent. However, to use it on a machine, you need
software
to be able to seek to a specific track number, and activate the drive for a
read
without actually having the machine care about the data. This could also be
done
with a fairly simple device that would control the signals to drive needed
to
accomplish the testing.

>
> > However, as I mentioned, I have had success without the special disk or
> > a scope.
>
> Are there any detailed instructions on how this is done somewhere on the
> net perhaps?

I have not seen any, but I cannot say that I have looked for any. This is
just something
decided to try when I had no other alternative.

> I don't have a scope, but I guess this is something
that
> can be rented or borrowed from some kind soul, or even bought cheaply if
> the specs don't have to be very high.
> What kind of scope specs are we talking here?
>

It doesn't require a very high-end scope. I think I was using a 20MHz, but
it probably
could even be done with a 5 or 10. IIRC the recorded test signal is not
very high
frequency, and it is analog (a sine wave or close to it), so you don't need
to handle
the harmonics of the base frequency as you do with digital signals.

Note that for some devices the host adapter type is important. You
cannot use any SCSI devices with the LINK II but need the LINK97 for a
few. This is because the LINK97 has an SCSI ID of its own (initiator
identification), which is a feature other adapters do not offer.

I think I repeat myself, maybe other users can confirm this: There is no
reason why HDDRIVER should not work with the Micro ST. HDDRIVER supports
any ICD-compatible (and also non ICD-compatible) adapter.
It is very likely that something is wrong with your hardware setup.
Anyway, the LINK97 will definitely work.

>to allow me to connect a D-Link Parallel port Ethernet card?

I'm waiting for Elmar Hilgart to send me an adaptor for the Genius E3000II
parallel port adaptor I picked up recently - I don't know if your adaptor
uses the same chipset.

The ROM-port adaptor costs 35 Euros, including post to the UK.

Hello,

The Crazy-Dot was made to fit the inner bus of MegaSTs. It used a
96 MHz ET4000 and allowed up to 1024 x 768 x 256 or, for those lucky
enough to own the memory expansion daughterboard, 1280 x 1024 x 32K.
It used its own GDOS, named AMCGDOS, which allowed 1024 x 768 x 256
2 times faster than ST's 640 x 400 (!) and, when using NVDI instead,
it easilly could be 4~5 times faster (my own measures, using Calamus
displaying very heavy graphic pages).
I don't know much about the CD-2, except it used a 120 MHz processor,
and had a VME connector so as to be used on TTs and MegaSTEs.

I can easily imagine the speed increasement it could give on a TT,
according to what a CD-1 did on a MegaST!...
If you own a MegaSTE and can find a CD-2 for about 150 Eur., it's a
very good bargain. But, if it is more than 200 Eur., have a look at
http://gem.win.co.nz/mb/hw/ , as Mario Becroft's Galaxy seems to be
the fastest VME graphic card ever made for our machines, and its
price is (only) about 300 Eur., shipping from New-Zealand included.
I wrote /only/, because you still can find CD-2 for 300 Eur., and
I don't think they are so powerful as the Galaxy.

Bye,

J.-Luc

Sorry, it will _NOT_ work on a MegaSTE, as it uses the 68000 bus
conector of the MegaST, which is not compatible with the VME bus
of TT and MegaSTE.

> Everything is marked in Canadian Dollars (so you in the US who are
> looking for these will get these at a great bargain :))

No, because $40 CAD = $25 USD doesn't mean that a person US gets a better bargain. They're worth the exact same amount even though the figure is different. By that mentality a person in Italy could never afford it because it costs 55,500 ITL or a Turkish person would have to shovel out 34,300,000 TRL. That's 34 million!! But they can afford it because a person in Turkey gets paid 10 million per hour. It's all about relativity. Sorry to get on your case mate. Living in Canada and hearing people always complaining about the value of our dollar pisses me off. So what if our dollar is less the the USD? Our hourly wages are higher than a person's in the US.

Joshua.

mhhh..
I think no.
Some copy-protections were made on special industrial 'copy-stations'
which made patterns/formats/'bugs' on
a floppy disks that are not re-produceable.
(PC floppies even can't read 11 sectors DD-disks - (some may can do
this!))
Also remember the large variety of PC-floppy manufacturers - and look on
the Atari Floppy
manufacturers: only one! (Western Digital) (for my knowledge)

'st image files' = image file for a emulators, I assume.
--> Even if you could make an image file out of a protected disk, the
image file had to be build
in a much more complex format than the ST/MSA format ...
+ you would need at least an 99.9% perfect emulation of the disk-access
stuff - which is not
done up to now.

Regards.

I updated my page about Eiffel, a PS/2 interface for Atari.
This update is about the firmware, which fix a problem with
mouse and keyboard timing synchronisations.

I added the RESET command support, to swicth off the CAPS lock
indicator if the Atari is rebooting.

>Is there a way of making the computer boot from a floppy (i.e. if a
>floppy is inserted with AUTO programs and/or ACCessories) when a hard
>disk is connected (and turned on)?

If memory serves (this is the routine on the TT and Hades):
1. Switch power off and insert chosen floppy.
2. Switch on and *as soon as* the power led lights up, hold ALTERNATE
3. When the floppydrive led lights up, release Alternate.
4. Wait a few seconds, then press any key.
If there are folders on the floppy for AUTO and CPX, they will be read.
(You can have AHDI.prg or HDDriver.prg in this AUTO).

Best of luck, hallvard.
Charles.

I have a Crazy Dots 2 in my TT, and the speed in 256 colours is about the same as an unaccelerated Falcon in the same resolution... This is with NVDI 5. The CD-2 doesn't have any hardware acceleration (atleast the NVDI-driver doesn't use any), so it's not very fast.

> I wrote /only/, because you still can find CD-2 for 300 Eur., and
> I don't think they are so powerful as the Galaxy.

Indeed. I bought my CD-2 for 40 EUR, and I really wouldn't pay much more for one. It's not very fast, and it has only 1Mb RAM. The Galaxy has hardware acceleration and a lot more RAM.

And so will STinG from http://www.ettnet.se/~dlanor/

If you can make any of the other computers talk SLIP and act as a router
just put up a nullmodem cable to the Atari running STinG forming a
subnet. You will also have to add a route to this subnet on _all_ other
computers on the LAN one level up. This is because they must now which
computer is the gateway to the Atari subnet.

This is possible to setup but some have had difficulties to make it work.
It does work here at my place, though.

But you seem to mean an Ethernet solution for Atari... A harder question
to answer is how to get the Ethernet adapters.

Did you get any answer to this? I've been away for a couple of weeks
so maybe I've missed them...

> I have a 8Mb TT030 with unknown HD size.

Grab Profile or Sysinfo to determine quite a bit about the machine you
have in front of you. Both are available on the internet as shareware.
For Profile I think it's http://www.stsd.demon.co.uk/linnhe.html

> 1. All the combinations of replacement kernels, VDI, blah, blah has
> me totally confused. Please, what is the VERY best combination of
> products to have picture backdrops, multitasking, CLI, and colored
> icons?

There'll be as many different opinions, but Magic\NVDI\Jinnee and a
few additional utilities should combine compatibility and power enough
for you. They're all commercial.

> 2. Where can I find a network card? Any network card. Any form of
> networking will do, just so I can get programs off the net to the TT030.
> Could be modem, dont't care. What is the TCP/IP stack of choice.

You don't need a network card. The only hardware needed is a 57k6
external modem. Grab HSModem (freeware) and CAB (commercial) which you
can use with its own TCP\IP stack or with STinG (Freeware) and CAB_OVL.

> 3. What graphic card are/were available and what should I expect to pay.

Most are only available second hand. CrazyDots2 and Nova cards are
16-bit. I think the Matrix TC1208e was 32-bit. New prices ranged from
8-1500USD, but could be nearer 1-200 second hand if you're lucky
enough to locate one. They fit in the VME port and are driven by NVDI.

> 4. What's the max ram and HD size I can put in my TT.

The AixTT card can handle 128Mb now, I think. My card has 32Mb right
now. The standard Atari board went up to 16Mb I think.

> 5. Where can you buy new/used software in the US these days. It seems
> that all the obvious places are out of business, etc.

I'll leave that for someone more up-to-date than me. You can import
direct from Atari Workshop/System Solutions in the UK in a worst case
scenario.

> 6. What is the list of must have apps/utilities for a machine that
> will be on the web, need browser capability, ftp, write simple docs.

I use a simple combination of Newsie and Everest, but others swear by
MyMail and QED. They'll each do the job easily enough. There are
accompanying programs to CAB, which someone else will be better placed
to tell you about. they may all be overkill - I've used Edhak as a
text editor before now...

> My ultimate goal would be to have ethernet networking, large 16-bit video

I don't know anything about Ethernet (on any platform tbh!) but the
rest is easily possible on the TT platform. You probably couldn't ahve
a better base to build from.

> Lastly, where are all the cool shareware and PD collection sites

>program...

If you set the right environment variable for your program it won't
matter what you've got set in Install Application, because the
programs will find their RSC's and INF files. Am I wrong?

What I'm really saying is that I don't think it's up to TOS to have a
right or wrong setting - it's dependent on the program.

I think what TOS is doing is allowing you to set up local environment
variables to allow you to double-click on user files from the desktop
in the case where the program doesn't allow you to set them seperately
and doesn't look for its own resources properly.

Any opinions on this statement?

Message-ID: <1014778285.15746.0@eurus.uk.clara.net>
Source record: 37444

What a great thread ?

NOT !

"Darkling" you really are a very sad person. Why the Atari users and
myself have risen to your bait is beyond me but here are my thoughts.

It is true that the Amiga's graphics and sound systems where better
that the ST's but it all depends upon the application. The Amiga made
a great Games platform with poor ports appearing on the ST market,
it's just a shame that the piracy levels for the Amiga was so great that
the serious developers moved on.
(How much pirate software did you acquire at the time?)
Moving away from the Games market the ST excelled and showed it's
true colours. The OS may not have been multi tasking but it was rock
solid and the serious developers created such programs as Cubase
that is still in use today. BTW don't even try and tell me that the Amiga
midi software is better because you will then be showing your true
ignorance.

Should we now move onto the Hardware itself as the Amiga was hardly
an engineering work of art. The power supply brick was about the weight of
an ST and had the reliability of a 10 year old Skoda. The disc drive
was a joke as replacement units where hard (and expensive) to acquire and
the format made data interchange between platforms difficult. The main
board of the Amiga was much less reliable than an ST, the two
IO controller chips used to cause no end of trouble and at times where
impossible to get. A lot has been made of the ST's Joystick and mouse ports
being placed at the front of the machine but to repair them only meant
taking
out the keyboard and soldering up the joints, unlike the Amiga having to
be completely stripped down and the board repaired.

Lastly (as I am now getting bored) lets take a look at the two companies
themselves. If commodore really thought that the Amiga was such a
superior product then why didn't they sell it that way instead of
entering into a price war with Atari, that ultimately meant neither company
was making good money. Atari where guilty of sitting on their arses and not
releasing new (bigger and faster) machines quickly enough to the market
but Commodore used to bring out new stuff all the time that put a huge drain
on their resources and they went bust first.

Just face it "Darkling" the Amiga was _not_ always better as it simply
depends upon your application.

NOW PISS OF BACK TO YOUR AMIGA GROUP.

Goodbye

Dave

say what you will about the Tramiels, they were geniuses compared to
the antics of the "Three Stooges" (Gould, Mehta, and General Alexander
Haig) during the last couple of years of Commodore's life. Though
probably the reason the Tramiels kept on making computers right up until
Commodore went bust was that Sam Tramiel wanted to see Irving Gould go
down in flames first.

Wrong.

DD = 3ms step rate

HD = 6ms step rate

Nothing to do with the doubled clock as above.

HD drives with a 3ms step rate will loose head position which is not always
apparent when formatting as the seek to next track is only one pulse, but
when
reading or writing to the disk afterwards a seek to say track 47 will
generally fail.

By default Tos 2.06 uses a step rate of 6ms. If only using DD then you can
set it
to 3ms to stop the grinding noise.

Tos 2.06 by default always uses 6ms irrespective of the disc inserted.

That could well be true.

I just feel it's a shame that Atari made the Falcon a 16 bit machine when
the
market was ripe for a decent 32 bit platform.

This duckling is a luser in every sense of the word. Do yourself a favor
and activate your spam filter. Only takes a second, unless you have to
refer to the manual. I got out the manual, and I must say after setting
up several filters, this group looks quite peaceful again. ;-)

Sorry for all the locals and their offspring that reside here, but....

Sinplop, your the biggest ass I've never met. You have been the most
ignorant ass for the last 5 or 6 years in all the Atari groups. You're
a total dick head. This new "Dark Turd" kid holds nothing to you. He
might as well just give up now, he could never meet your level of
moronic intelligence. You serve no purpose. You're a maggot eating its
way through the rotten fabric of your parent's upbringing. Did I say
you're a total dick head? You're the green crap on a dog's dick.
You're a festering puss blister. You are the balls of shit stuck to
Marilyn Mansions ass.
Unfortunately, you live in America, and you have the freedom of
speech. Otherwise the Atari Jihad would have slit your nuts and
stuffed them in your bloody gob many years ago.
Wow, that felt good!

Atari rules, and all that stuff.
Your very old friend, Michael.

Even though the TT has 32 bit RAM, it doesn't have a 32 bit VME bus. The
VME bus has IIRC only a 16 bit data bus, and like almost everything on the
TT it's accessed at 16MHz.

>without any problems.

Beware that a large number of icons in DESKICON.RSC, whatever the limit be,
and if there is one at all, is a feature which can not be utilized to its
full extent, because there is a limitation to the size of NEWDESK.INF -
i.e. you can not make many icon assignments even if you have a large resource
file because NEWDESK.INF would become too large. It is recommended that
NEWDESK.INF does not exceed about 2-3 KB (I think that 4KB is absolute
maximum). There is a patch (called SHELLBUF or so) to enable using larger
NEWDESK.INF (up to 32KB, I think). There is also a limitation to the number
of icons that can be placed on the desktop (i.e. even if NEWDESK.INF is
within acceptable size range) but this can be patched too.

Isn't the use of two RSC files (mono and colour) also present in TOS 4.* ??
So I think that this approach was not Ronald's invention.

The symptoms with your other systems are beginning to sound more like
software (formatting) issue than alignment. Do you know anyone who
could format a disk on a

Another thing that you should possibly check is drive speed on the Mac
and the Mega STe. It is unlikely that it is causing this, but you should
check everything when dealing with a problem this strange. I don't know
about the Mac, but there use to be a few RPM checkers for the ST. I'm
sure I still have one, but I'm just now in the process of firing up all of
my

old equipment and seeing what works. I started getting into the various
Atari newsgroups awhile back, and it made me want to check out my old
stuff. (I can't say my wife understands or is all that thrilled about
it--we
have a very full and cluttered house as it is). I was starting with my old
8-bit
stuff and have had to fix a couple of things. I'll be getting out my old ST
hardware soon.

Sorry, but... wrong, as will be seen from several quotings below.
You have to SET 6ms but that does not mean that the drive will
actually recevie it...

>By default Tos 2.06 uses a step rate of 6ms. If only using DD then you can
>set it to 3ms to stop the grinding noise.

This is true- TOS 2.06 was intended primarily for MSTe machines which had
the doubled clock frequency feature. Besides the step rate TOS2.06 recognizes
another parameter called "hdmode" which is very relevant for operation and
the value of which is kept in a register at $FF860E which the ordinary
ST machines do not have (what I would like to know is WHERE is this register
located- is it in the AJAX chip or in the GAL in the HD circuits of
a MSTe machine? This could have a significant effect on the design
of a hypothetical ideal HD-drive upgrade).

This is the beginning of the source code of SEEKUP10, a program which
is used to adjust TOS 2.06 when used on STs with a DD floppy drive:

>/***
>*
>* SEEKUP
>*
>* Short description:

```

No. All should work ok. If only DD mode is used then the drive doesn't care.

> Regarding my disk drive problems when transferring between the Mac and

Another thing to try is writing small files to a fresh disk. If the problems
occur
once the disk has started to fill up then that's probably due to
misalignment.

Source record: 37464

Did anyone make a version of audiodev.xdd for use on a Milan
with a MilanBlaster card? The existing (non-Milan) versions
fail looking for Atari-specific hardware. I tried looking
on the Milan website (www.milan-computer.de) but the "updates"
page seems to have disappeared.

I think CD1 was 15-bit, allowing up to 32768 colours and there was an
extension that allowed 16-bit up to 65736. CD2 is 24-bit, as you say -
except I've got a problem with mine which means I've lost this
palletless true colour mode B^<

>>>> Are they working in a TT and as well as in a Mega STE?
>>> Works in my TT. I don't know about the MegaSTE, my manual is
>>> german. ;-)

Mega STe is fine. My CD2 card was originally owned by Darryl Piper,
then Andrew Lee - both of whom used it in a Mega STe at one time IIRC.

>>>> Where can I find drivers?
>>> The original drivers are very bad. NVDI 4.x ET4000 version, or the
>>> newer NVDI v5.x package will fully drive the card.

There were actually versions from NVDI v2.51 - I had master disks at
one time which were needed for entering the serial number to install
upgrades. Not necessary with NVDI 5...

The original drivers were almost unusable...

>>>> Is there a spezial Homepage about them?
>>> Not that I am aware of, they are no longer made.
>> He... thanks alot! These Infos are helping very much!

You'll also need the VMG4000 program by Andreas Winter - it's a Video
Mode generator that allows you to create additional screen resolutions
in each colour depth from 2 to 16m colours. I'm not sure if it's part
of the NVDI package, but an upgrade can be found from a link at Jo
Vandeweghe's site.

> it easily could be 4~5 times faster (my own measures, using Calamus
> displaying very heavy graphic pages).

This was the original and seperate Megabus version of Crazy dots for
the Mega ST.

> I don't know much about the CD-2, except it used a 120 MHz processor,
> and had a VME connector so as to be used on TTs and MegaSTEs.
> I can easily imagine the speed increasement it could give on a TT,
> according to what a CD-1 did on a MegaST!...

Err... this is not true. Graphic display in a high colour mode, even
with NVDI, will easily be 20% slower than without a graphics card and
_no_ NVDI. Don't get a graphics card for speed - that's for damn sure!

Message-ID: <u7rnan8a7hlse5@corp.supernews.com>
Source record: 37472

I have some bad news for people who were hoping to get a romport adapter for the Genius E3000-II from me. I outlined it all in detail in this article on my site referenced at the bottom. There you can read and get a feel for what happened. I apologize for this, but without an RTL8012 based adapter I can't even test what I produce, if I actually COULD produce decent results with this evil press-n-peel transfer paper. I apologize to the few people who responded. I was hopeful, but maybe a little overzealous. All hope is not gone however, if I can find an RTL8012 based adapter, I WILL produce adapters for people, assuming I can also get the press-n-peel stuff to work.

For now, read here:
http://pikachu.atari-source.com/modules.php?op=modload&name=Articles&file=index&req=viewarticle&artid=12

> --> Even if you could make an image file out of a protected disk, the

Well you can. Try this :
http://www.oldskool.org/disk2fdi/
...or create an ADF file on an Amiga from a ST-disk.

> image file had to be build
> in a much more complex format than the ST/MSA format ...

Right. Such formats already exists: ADF (format of Amiga disk-image
files), which is used by SainT, and FDI (see above).

> + you would need at least an 99.9% perfect emulation of the disk-access
> stuff - which is not
> done up to now.

Well, this may change... See http://fast.emuunlim.com/. I know the
guy who is doing this, and he is not going to be self-satisfied with
an approximate emulation (to say the least :) !). But (and therefore)
don't except it too soon...

However I have not tested all this myself yet so I can't be much
more of help here...

You get the clicks in one of your dummy variables.

Do some thing like this:
event= evnt_multi(MU_MESAG|MU_BUTTON,2,1,1,0,0,0,0,0,0,0,
0,0,0,&messbuf,0,0,&mousex,&mousey,&mstate,&dummy,&key,&mclicks);

then you have the number of clicks in mclicks.

Maybe true for a Crazy Dots or any other ET4000 based cards, but most graphics cards will be many times faster than the original graphics. The Eclipse in my Falcon is incredibly fast compared to everything else I've seen for Ataris and clones, it's even noticable faster than the S3 in my Milan060.

If you're looking for second hand graphics card for a TT, try finding a Nova (any Nova, they're all fast), that's one really good card. I had one in my Falcon for a long time, and was very pleased with it. It's a lot better than the Crazy Dots.

I don't think there's one for the MilanBlaster, but I know that Ozk is writing one for GSXB (http://assemsoft.atari.org/). It might work with MilanBlaster as well, as they have compatible XBIOS interfaces. I have a SoundBlaster PCI64 (I think, maybe it's a PCI16) in my Milan and use Ozk's GSXB-driver, it works quite well.

> on the Milan website (www.milan-computer.de) but the "updates"

> Milan060.

The VDI driver for the Eclipse uses the ATI RageIIc acceleration routines.
Moreover, the Videl is supposed (your should set it) to be in a ST High rezolution for the 030 to gain access to STRAM.
So it's somehow very fast for a Falcon but for the display only ;-)

I have a Viking card (1280*960*monochrome) on the 68Kbus on my MegaST4.
There's a location on it to put a chip. I have tried with a 68881, but apparently, that does nothing and makes crash my old Calamus S (1992) when printing.
Is this location for a blitter ? If yes, must I translate the one from the mother board, or add another ?

Thanks for replying :)

1780. Update from mars of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-02-28 14:06:54 UTC
From: Francois Le_Coat/mailaxis <lecoat@ief.u-psud.fr>
Message-ID: <3C7E397E.1CF54180@ief.u-psud.fr>
Source record: 37484

Hi all,

I just released on my piece of web, my Eureka software.
It's a 2D Graph Describer and 3D Modeller. This software
is shareware. For shareware or freeware authors, the
registering is without any conditions, following the
shareware exchange scheme. For people that are not
software authors, the registering fees are 15 Euros.
Let people know ...

The main update is sound support for MagiC Mac, via
the MagXSound driver written by Didier Mï¿½quignon
(also author of the great Aniplayer). There also
should be sound support for MilanBlaster on Hades
or Milan thanks to GSXB from Odd Skancke. I simply
have only a P-Sound card on my Hades 060. I don't
have example programs for the usage of sound circuits
(DMA or others). So I will specially require your
feedback, to tell me about troubles you may have
encountered with sounds and Eureka.

It will soon past 6 years since Eureka is available
on the WEB. It is now a quite mature software in
its actual release. I'm sure you will agree. You are
warmly welcome to report me about your experience.

See you soon for updated news about ATARI front-line ...

-- Franï¿½ois LE COAT

So does Nova-VDI, the VDI for the old Matrix cards, the S3 driver for the Milan etc. But Johan's RageII-driver is rather clever with it's caching, I don't think any other VDI use this.

> Moreover, the Videl is supposed (your should set it) to be in a ST High

I have a small program that sets the Videl to something like 320x200x2bit with a very low vertical frequency.

> So it's somehow very fast for a Falcon but for the display only ;-)

Yes, but that's the purpose, isn't it? ;-)

> I have a Viking card (1280*960*monochrome) on the 68Kbus on my MegaST4.

IIRC (I haven't seen a Viking card in more than ten years) this socket is for a 68881/2.

Videl can be turned off completely by a software way.

Could be, it is defiantly VME (as I have it in my TT) and it also has an add-on board. With NVDI it is fast and looks good (even if it is a bitch to set-up).

I never managed to get the Redirect program to work (or maybe I have it wrong), I thought that once it runs all of the text going to the normal screen at boot would be pushed to the CD card.

Elliot...

Sounds like an early Crazy Dots II with the "true colour" expansion.

> I never managed to get the Redirect program to work (or maybe I have it

Hmmm, it works very well on my TT. Unfortunately I don't have a monitor
(or desk space...) for my TT right now, so I can't check exactly how it's
set up.

Ok, here's the deal ...

I am running an Atari 1040st with 1 meg ram, a color monitor, and a Jaz 2 gig drive through ICD's "The Link" SCSI interface. What I need is a memory cost-effective way to emulate a monochrome screen on my Atari, have it be perfectably readable, and not use up a lot of memory. Preferable a solution that maps a mono screen onto a medium res monitor so that I can scroll about. If anyone has suggestions, please e-mail me. Thanks.

You could use a mono emulator like Sebra, or a better solution is to purchase a SVGA adapter that will let you use a cheap SVGA monitor as a mono ST monitor. I think Ken MacDonald of the TAF sells these, but not 100% sure.

Hope this helps

Simon

Hi Spanner-

It would be really helpful if you'd let us all know WHERE you
are. I have a few "extra" STs sitting in a box, and I'd let them
go for very little $, but I don't know where you are. These
things are pretty big, and the cost of shipping can unfortunately
offset any low price you might find. If you live in the Seattle,
WA USA area, let me know. If not, perhaps there is someone in
your area who also has a few STs to sell or give away.

-Clayton Murray
Seattle, WA USA

Hi,

I have a falcon in a tower and for some reason today I tried to put the
memorycard in place and when I switched it back on something inside
exploded (atleaset thats what it sounded like).
I tried with a normal falcon PSU and it does start but all I get is a
white screen, no logo, no nothing, it does sound all right but just a
white screen..

I must have touched something inside, maybe shortcircuit something.

Any ideas?

Fredrik.
